# The First Properties

### 1.1 Setup and the first examples

#### 1.1.1 Notations

All schemes are assumed to be separated. For a "scheme" which is not separated, we will use the term "prescheme".

Let A be a ring. We denote by Spec A the spectrum of A. For an ideal  $I \subset A$ , we use V(I) to denote the closed subscheme of Spec A defined by I.

Let S be Spec k, Spec  $\mathcal{O}_K$  or an algebraic variety. An S-variety is an integral scheme X which is of finite type and flat over S. For an algebraic variety, we mean a k-variety.

We will use k, K to denote fields, and k, K to denote their algebraically closure relatively.

Let X be an integral scheme. We denote by  $\mathcal{K}(X)$  the function field of X. For a closed point  $x \in X$ , we denote by  $\kappa(x)$  the residue field of x.

We denote the category of S-varieties by  $\mathbf{Var}_S$ . We denote by X(T) the set of T-points of X, that is, the set of morphisms  $T \to X$ .

Let X be an algebraic variety over k. A geometrical point is referred a morphism Spec  $\mathbf{k} \to X$ .

When refer a point (may not be closed) in a scheme, we will use the notation  $\xi \in X$ . We use  $Z_{\xi}$  to denote the Zariski closure of  $\{\xi\}$  in X. When we talk about a closed point on an algebraic variety, we will use the notation  $x \in X(\mathbf{k})$ .

### 1.1.2 Examples

# Appendix A

# Commutative Algebra

### A.1 Elementary Results

Yang: To be completed

### A.1.1 Rings and modules

In the appendix and all the note, the "ring" is always commutative and with identity. We denote by Spec A the set of prime ideals of a ring A. We denote by mSpec A the set of maximal ideals of A. Let  $I \subset A$  be an ideal of A. We define

$$V(I) \coloneqq \{\mathfrak{p} \in \operatorname{Spec} A \colon I \subset \mathfrak{p}\}.$$

Let  $\mathfrak{a},\mathfrak{b}$  be ideals of A. We define

$$(\mathfrak{a} : \mathfrak{b}) := \{ a \in A : a\mathfrak{b} \subset \mathfrak{a} \}.$$

This is an ideal of A.

Let rad(A) be the Jacobian radical of A, i.e., the intersection of all maximal ideals of A. Let nil(A) be the nilradical of A, i.e., the ideal of A consisting of all nilpotent elements.

**Proposition A.1.1.** Let A be a ring. Then we have

$$\operatorname{nil}(A) = \bigcap_{\mathfrak{p} \in \operatorname{Spec} A} \mathfrak{p}.$$

Proof. Yang: To be completed.

**Proposition A.1.2.** Let A be a ring,  $\mathfrak{p}, \mathfrak{p}_i$  prime ideals of A and  $\mathfrak{a}, \mathfrak{a}_i$  ideals of A.

- (a) Suppose  $\mathfrak{a} \subset \bigcup_{i=1}^n \mathfrak{p}_i$ . Then there exists i such that  $\mathfrak{a} \subset \mathfrak{p}_i$ .
- (b) Suppose  $\bigcap_{i=1}^n \mathfrak{a}_i \subset \mathfrak{p}$ . Then there exists i such that  $\mathfrak{a}_i \subset \mathfrak{p}$ .

*Proof.* Yang: To be completed.

Let M be an A-module. We say that M is *finite* if there exists an exact sequence

$$A^n \to M \to 0$$
.

We say that M is *coherent* if there exists an exact sequence

$$A^m \to A^n \to M \to 0$$
.

If A is a noetherian ring, then every finite A-module is coherent.

**Definition A.1.3.** Let A be a ring and M an A-module. The *support* of M is defined as

$$\operatorname{Supp} M := \{ \mathfrak{p} \in \operatorname{Spec} A \colon M_{\mathfrak{p}} \neq 0 \}.$$

The annihilator of M is defined as

$$\operatorname{Ann} M := \{ a \in A \colon aM = 0 \}.$$

This is an ideal of A.

**Proposition A.1.4.** Let A be a ring and M a finite A-module. Then Supp  $M = V(\operatorname{Ann} M)$ . In particular, Supp M is a closed subset of Spec A.

Proof. Yang: To be completed.

#### A.1.2 Localization

**Definition A.1.5.** Let A be a ring and  $S \subset A$  a multiplicative subset, i.e.,  $1 \in S$  and  $s_1, s_2 \in S$  implies  $s_1s_2 \in S$ . The *localization* of A at S is defined as

$$S^{-1}A := A \times S / \sim,$$

where  $(a, s) \sim (b, t)$  if there exists  $u \in S$  such that u(at - bs) = 0. Yang: To be completed.

Proposition A.1.6.

### A.1.3 Chain conditions

### A.1.4 Nakayama's Lemma

**Theorem A.1.7** (Nakayama's Lemma). Let A be a ring and  $\mathfrak{M}$  be its Jacobi radical. Suppose M is a finitely generated A-module. If  $\mathfrak{a}M=M$  for  $\mathfrak{a}\subset\mathfrak{M}$ , then M=0.

Proof. Suppose M is generated by  $x_1, \dots, x_n$ . Since  $M = \mathfrak{a}M$ , formally we have  $(x_1, \dots, x_n)^T = \Phi(x_1, \dots, x_n)^T$  for  $\Phi \in M_n(\mathfrak{a})$ . Then  $(\Phi - \mathrm{id})(x_1, \dots, x_n)^T = 0$ . Note that  $\det(\Phi - \mathrm{id}) = 1 + a$  for  $a \in \mathfrak{a} \subset \mathfrak{M}$ . Then  $\Phi - \mathrm{id}$  is invertible and then M = 0.

**Remark A.1.8.** The finiteness of M is crucial in Nakayama's Lemma. For example, let  $\overline{\mathbb{Z}}$  be the ring of algebraic integers in  $\overline{\mathbb{Q}}$ . Choose a non-zero prime ideal  $\mathfrak{p}$  of  $\overline{\mathbb{Z}}$ . Then we have that  $\mathfrak{p}\overline{\mathbb{Z}}_{\mathfrak{p}} = \mathfrak{p}^2\overline{\mathbb{Z}}_{\mathfrak{p}}$ .

Indeed, if  $a \in \mathfrak{p}\overline{\mathbb{Z}}_{\mathfrak{p}}$ , let  $b = \sqrt{a} \in \overline{\mathbb{Z}}_{\mathfrak{p}}$ . Then  $b^2 = a \in \mathfrak{p}\overline{\mathbb{Z}}_{\mathfrak{p}}$  and whence  $b \in \mathfrak{p}\overline{\mathbb{Z}}_{\mathfrak{p}}$  since  $\mathfrak{p}$  is prime. It follows that  $a = b^2 \in \mathfrak{p}^2\overline{\mathbb{Z}}_{\mathfrak{p}}$ .

**Proposition A.1.9** (Geometric form of Nakayama's Lemma). Let  $X = \operatorname{Spec} A$  be an affine scheme,  $x \in X$  a closed point and  $\mathcal{F}$  a coherent sheaf on X. If  $a_1, \dots, a_k \in \mathcal{F}(X)$  generate  $\mathcal{F}|_x = \mathcal{F} \otimes \kappa(x)$ , then there is an open subset  $U \subset X$  such that  $a_i|_U$  generate  $\mathcal{F}(U)$ .

Proof. Yang: To be completed.

Corollary A.1.10. Let X be a scheme and  $\mathcal{F}$  a coherent sheaf on X. Then the function  $x \mapsto \dim_{\kappa(x)} \mathcal{F}|_x$  is upper semicontinuous.

Proof. Yang: To be completed.

#### A.1.5 Nullstellensatz

**Theorem A.1.11** (Noether's Normalization Lemma). Let A be a k-algebra of finite type. Then there is an injection  $k[T_1, \dots, T_d] \hookrightarrow A$  such that A is finite over  $k[T_1, \dots, T_d]$ .

**Remark A.1.12.** Here A does not need to be integral. For example,

**Theorem A.1.13** (Hilbert's Nullstellensatz). Let A be a

### A.2 Associated prime ideals

### A.2.1 Associated prime ideals

**Definition A.2.1** (Associated prime ideals). Let A be a noetherian ring and M an A-module. The associated prime ideals of M are the prime ideals  $\mathfrak{p}$  of form  $\mathrm{Ann}(x)$  for some  $x \in M$ . The set of associated prime ideals of M is denoted by  $\mathrm{Ass}(M)$ .

**Example A.2.2.** Let  $A = \mathbf{k}[x, y]/(xy)$  and M = A. First we see that  $(x) = \operatorname{Ann} y, (y) = \operatorname{Ann} x \in \operatorname{Ass} M$ . Then we check other prime ideals. For (x, y), if xf = yf = 0, then  $f \in (x) \cap (y) = (0)$ . If  $(x - a) = \operatorname{Ann} f$  for some f, note that  $y \in (x - a)$  for  $a \in \mathbf{k}^*$ , then  $f \in (x)$ . Hence f = 0. Therefore  $\operatorname{Ass} M = \{(x), (y)\}$ .

**Example A.2.3.** Let  $A = \mathbf{k}[x,y]/(x^2,xy)$  and M = A. The underlying space of Spec A is the y-axis since  $\sqrt{(x^2,xy)} = (x)$ . First note that  $(x) = \operatorname{Ann} y, (x,y) = \operatorname{Ann} x \in \operatorname{Ass} M$ . For (x,y-a) with  $a \in \mathbf{k}^*$ , easily see that xf = (y-a)f = 0 implies f = 0 since  $A = \mathbf{k} \cdot x \oplus \mathbf{k}[y]$  as  $\mathbf{k}$ -vector space. Hence  $\operatorname{Ass} M = \{(x), (x,y)\}$ .

**Lemma A.2.4.** Let A be a noetherian ring and M an A-module. Then the maximal element of the set

 $\{\operatorname{Ann} x \colon x \in M_{\mathfrak{p}}, x \neq 0\}$ 

belongs to Ass M.

6

*Proof.* We just need to show that such Ann x is prime. Otherwise, there exist  $a, b \in A$  such that  $ab \in \operatorname{Ann} x$  but  $a, b \notin \operatorname{Ann} x$ . It follows that  $\operatorname{Ann} x \subsetneq \operatorname{Ann} ax$  since  $b \in \operatorname{Ann} ax \setminus \operatorname{Ann} x$ . This contradicts the maximality of  $\operatorname{Ann} x$ .

An element  $a \in A$  is called a zero divisor for M if  $M \to aM, m \mapsto am$  is not injective.

Corollary A.2.5. Let A be a noetherian ring and M an A-module. Then

$$\{\text{zero divisors for } M\} = \bigcup_{\mathfrak{p} \in \text{Ass } M} \mathfrak{p}.$$

**Lemma A.2.6.** Let A be a noetherian ring and M an A-module. Then  $\mathfrak{p} \in \mathrm{Ass}_A M$  iff  $\mathfrak{p} A_{\mathfrak{p}} \in \mathrm{Ass}_{A_{\mathfrak{p}}} M_{\mathfrak{p}}$ .

Proof. Suppose  $\mathfrak{p}A_{\mathfrak{p}} \in \mathrm{Ass}_{A_{\mathfrak{p}}} M_{\mathfrak{p}}$ . Let  $\mathfrak{p}A_{\mathfrak{p}} = \mathrm{Ann} \, y_0/c$  with  $y_0 \in M$  and  $c \in A \setminus \mathfrak{p}$ . For  $a \in \mathrm{Ann} \, y_0$ ,  $ay_0 = 0$ . Then  $a/1 \in \mathfrak{p}A_{\mathfrak{p}}$ . It follows that  $a \in \mathfrak{p}$ . Hence  $\mathrm{Ann} \, y_0 \subset \mathfrak{p}$ .

Inductively, if Ann  $y_n \subsetneq \mathfrak{p}$ , then there exists  $b_n \in A \setminus \mathfrak{p}$  such that  $y_{n+1} := b_n y_n$ , Ann  $y_{n+1} \subset \mathfrak{p}$  and Ann  $y_n \subsetneq \text{Ann } y_{n+1}$ . To see this, choose  $a_n \in \mathfrak{p} \setminus \text{Ann } y_n$ . Then  $(a_n/1)y_n = 0$  since  $a_n/1 \in \mathfrak{p} A_{\mathfrak{p}}$ . By definition, there exist  $b_n \in A \setminus \mathfrak{p}$  such that  $a_n b_n y_n = 0$ . This process must terminate since A is noetherian. Thus Ann  $y_n = \mathfrak{p}$  for some n. Hence  $\mathfrak{p} \in \text{Ass}_A M$ .

Conversely, suppose  $\mathfrak{p} = \operatorname{Ann} x \in \operatorname{Ass} M$ . If  $(a/s)(x/1) = 0 \in M_{\mathfrak{p}}$ , there exist  $t \in A \setminus \mathfrak{p}$  such that tax = 0. It follows that  $ta \in \mathfrak{p}$  and then  $(a/s) \in \mathfrak{p}A_{\mathfrak{p}}$ . Hence  $\mathfrak{p}A_{\mathfrak{p}} \in \operatorname{Ass}_{A_{\mathfrak{p}}} M_{\mathfrak{p}}$ .

**Proposition A.2.7.** We have Ass  $M \subset \operatorname{Supp} M$ . Moreover, if  $\mathfrak{p} \in \operatorname{Supp} M$  satisfies  $V(\mathfrak{p})$  is an irreducible component of  $\operatorname{Supp} M$ , then  $\mathfrak{p} \in \operatorname{Ass} M$ .

*Proof.* For any  $\mathfrak{p} = \operatorname{Ann} x \in \operatorname{Ass} M$ , we have  $A/\mathfrak{p} \cong A \cdot x \subset M$ . Tensoring with  $A_{\mathfrak{p}}$  gives  $A_{\mathfrak{p}}/\mathfrak{p}A_{\mathfrak{p}} \hookrightarrow M_{\mathfrak{p}}$  since  $A_{\mathfrak{p}}$  is flat. Hence  $M_{\mathfrak{p}} \neq 0$  and  $\mathfrak{p} \in \operatorname{Supp} M$ .

Now suppose  $\mathfrak{p} \in \operatorname{Supp} M$  and  $V(\mathfrak{p})$  is an irreducible component of  $\operatorname{Supp} M$ . First we show that  $\mathfrak{p} \in \operatorname{Ass}_{A_{\mathfrak{p}}} M_{\mathfrak{p}}$ . Let  $x \in M_{\mathfrak{p}}$  such that  $\operatorname{Ann} x$  is maximal in the set

$$\{\operatorname{Ann} x \colon x \in M_{\mathfrak{p}}, x \neq 0\}.$$

Then we claim that  $\operatorname{Ann} x = \mathfrak{p} A_{\mathfrak{p}}$ . First,  $\operatorname{Ann} x$  is prime by Lemma A.2.4. If  $\operatorname{Ann} x \neq \mathfrak{p}$ , then  $V(\operatorname{Ann} x) \supset V(\mathfrak{p})$ . This implies that  $\operatorname{Ann} x \notin \operatorname{Supp} M_{\mathfrak{p}}$  since  $\operatorname{Supp} M_{\mathfrak{p}} = \operatorname{Supp} M \cap \operatorname{Spec} A_{\mathfrak{p}}$ . This is a contradiction. Thus  $\mathfrak{p} A_{\mathfrak{p}} \in \operatorname{Ass}_{A_{\mathfrak{p}}} M_{\mathfrak{p}}$ . By Lemma A.2.6, we have  $\mathfrak{p} \in \operatorname{Ass} M$ .

Remark A.2.8. The existence of irreducible component is guaranteed by Zorn's Lemma.

**Definition A.2.9.** A prime ideal  $\mathfrak{p} \in \operatorname{Ass} M$  is called *embedded* if  $V(\mathfrak{p})$  is not an irreducible component of  $\operatorname{Supp} M$ .

**Example A.2.10.** For  $M = A = \mathbf{k}[x, y]/(x^2, xy)$ , the origin (x, y) is an embedded point.

**Proposition A.2.11.** If we have exact sequence  $0 \to M_1 \to M_2 \to M_3$ , then Ass  $M_2 \subset$  Ass  $M_1 \cup$  Ass  $M_3$ .

Proof. Let  $\mathfrak{p} = \operatorname{Ann} x \in \operatorname{Ass} M_2 \setminus \operatorname{Ass} M_1$ . Then the image [x] of x in  $M_3$  is not equal to 0. We have that  $\operatorname{Ann} x \subset \operatorname{Ann}[x]$ . If  $a \in \operatorname{Ann}[x] \setminus \operatorname{Ann} x$ , then  $ax \in M_1$ . Since  $\operatorname{Ann} x \subsetneq \operatorname{Ann} ax$ , there is  $b \in \operatorname{Ann} ax \setminus \operatorname{Ann} x$ . However, it implies  $ba \in \operatorname{Ann} x$ , and then  $a \in \operatorname{Ann} x$  since  $\operatorname{Ann} x$  is prime, which is a contradiction.

Corollary A.2.12. If M is finitely generated, then the set Ass M is finite.

Proof. For  $\mathfrak{p} = \operatorname{Ann} x \in \operatorname{Ass} M$ , we know that the submodule  $M_1$  generated by x is isomorphic to  $A/\mathfrak{p}$ . Inductively, we can choose  $M_n$  be the preimage of a submodule of  $M/M_{n-1}$  which is isomorphic to  $A/\mathfrak{q}$  for some  $\mathfrak{q} \in \operatorname{Ass} M/M_{n-1}$ . We can take an ascending sequence  $0 = M_0 \subset M_1 \subset \cdots \subset M_n \subset \cdots$  such that  $M_i/M_{i-1} \cong A/\mathfrak{p}_i$  for some prime  $\mathfrak{p}_i$ . Since M is finitely generated, this is a finite sequence. Then the conclusion follows by Proposition A.2.11.

### A.2.2 Primary decomposition

**Definition A.2.13.** An A-module is called *co-primary* if Ass M has a single element. Let M be an A-module and  $N \subset M$  a submodule. Then N is called *primary* if M/N is co-primary. If Ass  $M/N = \{\mathfrak{p}\}$ , then N is called  $\mathfrak{p}$ -primary.

**Remark A.2.14.** This definition coincide with primary ideals in the case M = A. Recall an ideal  $\mathfrak{q} \subset A$  is called *primary* if  $\forall ab \in \mathfrak{p}, a \notin \mathfrak{q}$  implies  $b^n \in \mathfrak{q}$  for some n.

Let  $\mathfrak{q}$  be a  $\mathfrak{q}$ -primary ideal. Since Supp  $A/\mathfrak{q} = \{\mathfrak{p}\}$ ,  $\mathfrak{p} \in \operatorname{Ass} A/\mathfrak{q}$ . Suppose  $\operatorname{Ann}[a] \in \operatorname{Ass} A/\mathfrak{q}$ . Then  $\mathfrak{p} \subset \operatorname{Ann}[a]$  since  $V(\mathfrak{p}) = \operatorname{Supp} A/\mathfrak{q}$ . If  $b \in \operatorname{Ann}[a]$ , then  $ab \in \mathfrak{q}$  and  $a \notin \mathfrak{q}$ . Hence  $b^n \in \mathfrak{q}$ , and then  $b \in \mathfrak{p}$ . This shows that  $\operatorname{Ass} A/\mathfrak{q} = \{\mathfrak{p}\}$  and  $\mathfrak{q}$  is  $\mathfrak{p}$ -primary as an A-submodule.

Let  $\mathfrak{q} \subset A$  be a  $\mathfrak{p}$ -primary A-submodule. First we have  $\mathfrak{p} = \sqrt{\mathfrak{q}}$  since  $V(\mathfrak{p})$  is the unique irreducible component of Supp  $A/\mathfrak{q}$ . Suppose  $ab \in \mathfrak{q}$  and  $a \notin \mathfrak{q}$ . Then  $b \in \mathrm{Ann}[a] \subset \mathfrak{p}$  since  $\mathfrak{p}$  is the unique maximal element in  $\{\mathrm{Ann}[c]: c \in A \setminus \mathfrak{q}\}$ . This implies that  $b^n \in \mathfrak{q}$ .

**Definition A.2.15.** Let A be a noetherian ring, M an A-module and  $N \subset M$  a submodule. A minimal primary decomposition of N in M is a finite set of primary submodules  $\{Q_i\}_{i=1}^n$  such that

$$N = \bigcap_{i=1}^{n} Q_i,$$

no  $Q_i$  can be omitted and  $\operatorname{Ass} M/Q_i$  are pairwise distinct. For  $\operatorname{Ass} M/Q_i = \{\mathfrak{p}\}$ ,  $Q_i$  is called belonging to  $\mathfrak{p}$ .

Indeed, if  $N \subset M$  admits a minimal primary decomposition  $N = \bigcap Q_i$  with  $Q_i$  belonging to  $\mathfrak{p}$ , then  $\operatorname{Ass}(M/N) = \{\mathfrak{p}_i\}$ . For given i, consider  $N_i := \bigcap_{j \neq i} Q_j$ , then  $N_i/N \cong (N_i + Q_i)/Q_i$ . Since  $N_i \neq N$ ,  $\operatorname{Ass} N_i/N \neq \emptyset$ . On the other hand,  $\operatorname{Ass} N_i/N \subset \operatorname{Ass} M/Q_i = \{\mathfrak{p}\}$ . It follows that  $\operatorname{Ass} N_i/N = \{\mathfrak{p}_i\}$ , whence  $\mathfrak{p}_i \in \operatorname{Ass} M/N$ . Conversely, we have an injection  $M/N \hookrightarrow \bigoplus M/Q_i$ , so  $\operatorname{Ass} M/N \subset \bigcup \operatorname{Ass} M/Q_i$ . Due to this, if  $Q_i$  belongs to  $\mathfrak{p}$ , we also say that  $Q_i$  is the  $\mathfrak{p}$ -component of N.

**Proposition A.2.16.** Suppose  $N \subset M$  has a minimal primary decomposition. If  $\mathfrak{p} \in \mathrm{Ass}\,M/N$  is not embedded, then the  $\mathfrak{p}$  component of N is unique. Explicitly, we have  $Q = \nu^{-1}(N_{\mathfrak{p}})$ , where  $\nu: M \to M_{\mathfrak{p}}$ .

*Proof.* First we show that  $Q = \nu^{-1}(Q_{\mathfrak{p}})$ . Clearly  $Q \subset \nu^{-1}(Q_{\mathfrak{p}})$ . Suppose  $x \in \nu^{-1}(Q_{\mathfrak{p}})$ . Then there exists  $s \in A \setminus \mathfrak{p}$  such that  $sx \in Q$ . That is,  $[sx] = 0 \in M/Q$ . If  $[x] \neq 0$ , we have  $s \in \text{Ann}[x] \subset \mathfrak{p}$ . This contradiction enforces  $Q = \nu^{-1}(Q_{\mathfrak{p}})$ .

Then we show that  $N_{\mathfrak{p}} = Q_{\mathfrak{p}}$ . Just need to show that for  $\mathfrak{p}' \neq \mathfrak{p}$  and the  $\mathfrak{p}'$  component Q' of N,  $Q'_{\mathfrak{p}} = M_{\mathfrak{p}}$ . Since  $\mathfrak{p}$  is not embedded,  $\mathfrak{p}' \not\subset \mathfrak{p}$ . Then  $\mathfrak{p} \notin V(\mathfrak{p}) = \operatorname{Supp} M/Q'$ . So  $M_{\mathfrak{p}}/Q'_{\mathfrak{p}} = 0$ .

**Example A.2.17.** If  $\mathfrak{p}$  is embedded, then its components may not be unique. For example, let  $M = A = \mathbf{k}[x,y]/(x^2,xy)$ . Then for every  $n \in \mathbb{Z}_{\geq 1}$ ,  $(x) \cap (x^2,xy,y^n)$  is a minimal primary decomposition of  $(0) \subset M$ .

Let A be a noetherian ring and  $\mathfrak{p} \subset A$  a prime ideal. We consider the  $\mathfrak{p}$  component of  $\mathfrak{p}^n$ , which is called n-th symbolic power of  $\mathfrak{p}$ , denoted by  $\mathfrak{p}^{(n)}$ . We have  $\mathfrak{p}^{(n)} = \mathfrak{p}^n A_{\mathfrak{p}} \cap A$ . In general,  $\mathfrak{p}^{(n)}$  is not equal to  $\mathfrak{p}^n$ ; see below example.

**Example A.2.18.** Let  $A = \mathbf{k}[x, y, z, w]/(y^2 - zx^2, yz - xw)$  and  $\mathfrak{p} = (y, z, w)$ . We have  $z = y^2/x^2, w = yz/x \in \mathfrak{p}^2 A_{\mathfrak{p}}$ , whence  $\mathfrak{p}^2 A_{\mathfrak{p}} = (z, w) \neq \mathfrak{p}^2$ .

**Theorem A.2.19.** Let A be a noetherian ring and M an A-module. Then for every  $\mathfrak{p} \in \mathrm{Ass}\,M$ , there is a  $\mathfrak{p}$ -primary submodule  $Q(\mathfrak{p})$  such that

$$(0) = \bigcap_{\mathfrak{p} \in \operatorname{Ass} M} Q(\mathfrak{p}).$$

*Proof.* Consider the set

$$\mathcal{N} := \{ N \subset M \colon \mathfrak{p} \notin \operatorname{Ass} N \}.$$

Note that  $\operatorname{Ass} \bigcup N_i = \bigcup \operatorname{Ass} N_i$  by definition of associated prime ideals. Then it is easy to check that  $\mathcal{N}$  satisfies the conditions of Zorn's Lemma. Hence  $\mathcal{N}$  has a maximal element  $Q(\mathfrak{p})$ . We claim that  $Q(\mathfrak{p})$  is  $\mathfrak{p}$ -primary. If there is  $\mathfrak{p}' \neq \mathfrak{p} \in \operatorname{Ass} M/Q(\mathfrak{p})$ , then there is a submodule  $N' \cong A/\mathfrak{p}$ . Let N'' be the preimage of N' in M. We have  $Q(\mathfrak{p}) \subsetneq N''$  and  $N'' \in \mathcal{N}$ . This is a contradiction. By the fact  $\operatorname{Ass} \bigcap N_i = \bigcap \operatorname{Ass} N_i$ , we get the conclusion.

Corollary A.2.20. Let A be a noetherian ring and M a finite A-module. Then every submodule of M has a minimal primary decomposition.

### A.3 Dimension and Depth

There are three numbers measuring the "size" of a local ring  $(A, \mathfrak{m})$ :

- $\dim A$ : the Krull dimension of A.
- depth A: the depth of A.

•  $\dim_{\kappa(\mathfrak{m})} T_{A,\mathfrak{m}}$ : the dimension of Zariski tangent space  $T_{A,\mathfrak{m}} := (\mathfrak{m}/\mathfrak{m}^2)^{\vee}$  as a  $\kappa(\mathfrak{m})$ -vector space.

Somehow the Krull dimension is "homological" and the depth is "cohomological".

**Definition A.3.1.** Let A be a noetherian ring. The *height of a prime ideal*  $\mathfrak{p}$  in A is defined as the maximum length of chains of prime ideals contained in  $\mathfrak{p}$ , that is,

$$\operatorname{ht}(\mathfrak{p}) := \sup\{n \mid \exists \text{ a chain of prime ideals } \mathfrak{p}_0 \subsetneq \mathfrak{p}_1 \subsetneq \cdots \subsetneq \mathfrak{p}_n = \mathfrak{p}\}.$$

The  $Krull\ dimension$  of A is defined as

$$\dim A := \max_{\mathfrak{p} \in \operatorname{Spec} A} \operatorname{ht}(\mathfrak{p}).$$

**Example A.3.2.** Let A be a PID. For every two non-zero prime ideals  $\mathfrak{p}_1$  and  $\mathfrak{p}_2$ , if  $\mathfrak{p}_1 = t_1 A \subset \mathfrak{p}_2 = t_2 A$ , then  $t_2 \mid t_1$  and hence  $\mathfrak{p}_1 = \mathfrak{p}_2$ . It follows that dim A = 1. Consequently, the ring of integers  $\mathbb{Z}$  and the polynomial ring k[T] in one variable over a field have Krull dimension 1.

**Definition A.3.3.** Let A be a noetherian ring,  $I \subset A$  an ideal and M a finitely generated A-module. A sequence  $t_1, \dots, t_n \in I$  is called an M-regular sequence in I if  $t_i$  is not a zero divisor on  $M/(t_1, \dots, t_{i-1})M$  for all i.

**Example A.3.4.** Let  $A = k[x,y]/(x^2,xy)$  and I = (x,y). Then depth<sub>I</sub> A = 0.

**Definition A.3.5.** Let A be a noetherian ring. For every  $\mathfrak{p} \in \operatorname{Spec} A$ ,  $\mathfrak{p}/\mathfrak{p}^2$  is a vector space over  $\kappa(\mathfrak{p})$ . The Zariski's tangent space  $T_{A,\mathfrak{p}}$  of A at  $\mathfrak{p}$  is defined as  $(\mathfrak{p}/\mathfrak{p}^2)^{\vee}$ , the dual  $\kappa(\mathfrak{p})$ -vector space of  $\mathfrak{p}/\mathfrak{p}^2$ .

### A.3.1 Artinian Rings and Length of Modules

**Definition A.3.6.** Let A be a ring and M an A module. A simple module filtration of M is a filtration

$$M = M_0 \supsetneq M_1 \supsetneq \cdots \supsetneq M_n = 0$$

such that  $M_i/M_{i-1}$  is a simple module, i.e. it has no submodule except 0 and itself. If M has a simple module filtration as above, we define the length of M as n and say that M has finite length.

The following proposition guarantees the length is well-defined.

**Proposition A.3.7.** Suppose M has a simple module filtration  $M = M_{0,0} \supseteq M_{1,0} \supseteq \cdots \supseteq M_{n,0} = 0$ . Then for any other filtration  $M = M_{0,0} \supset M_{0,1} \supset \cdots \supset M_{0,m} = 0$  with m > n, there exist k < m such that  $M_{0,k} = M_{0,k+1}$ .

Proof. We claim that there are at least  $0 \le k_1 < \cdots < k_{m-n} < m$  satisfies that  $M_{0,k_i} = M_{0,k_{i+1}}$ . Let  $M_{i,j} := M_{i,0} \cap M_{0,j}$ . Inductively on n, we can assume that there exist  $k_1, \cdots, k_{n-m+1}$  such that  $M_{1,k} = M_{1,k+1}$ . Consider the sequence

$$M_{0,0}/M_{1,0} \supset (M_{0,1}+M_{1,0})/M_{1,0} \supset \cdots \supset (M_{0,m}+M_{1,0})/M_{1,0} = 0$$

in  $M_{0,0}/M_{1,0}$ . Since  $M_{0,0}/M_{1,0}$  is simple, there is at most one  $k_i$  with  $M_{0,k_i}+M_{1,0}\neq M_{0,k_i+1}+M_{1,0}$ . And note that if  $M_{0,k_i}+M_{1,0}=M_{0,k_i+1}+M_{1,0}$  and  $M_{0,k_i}\cap M_{1,0}=M_{0,k_i}\cap M_{1,0}$ , then  $M_{0,k_i}=M_{0,k_i+1}$  by the Five Lemma.

**Example A.3.8.** Let A be a ring and  $\mathfrak{m} \in \mathrm{mSpec}\,A$ . Then  $A/\mathfrak{m}$  is a simple module. Yang: To be completed.

**Proposition A.3.9.** Let A be a ring and M an A-module. Then M is of finite length iff it satisfies both a.c.c and d.c.c.

*Proof.* Note that if M has either a strictly ascending chain or a strictly descending chain, M is of infinite length. Conversely, d.c.c guarantee M has a simple submodule and a.c.c guarantee the sequence terminates.

**Proposition A.3.10.** The length l(-) is an additive function for modules of finite length. That is, if we have an exact sequence  $0 \to M_1 \to M_2 \to M_3 \to 0$  with  $M_i$  of finite length, then  $l(M_2) = l(M_1) + l(M_3)$ .

*Proof.* The simple module filtrations of  $M_1$  and  $M_3$  will give a simple module filtration of  $M_2$ .  $\square$ 

**Proposition A.3.11.** Let  $(A, \mathfrak{m})$  be a local ring. Then A is artinian iff  $\mathfrak{m}^n = 0$  for some  $n \geq 0$ .

*Proof.* Suppose A is artinian. Then the sequence  $\mathfrak{m} \supset \mathfrak{m}^2 \supset \mathfrak{m}^3 \supset \cdots$  is stable. It follows that  $\mathfrak{m}^n = \mathfrak{m}^{n+1}$  for some n. By the Nakayama's Lemma A.1.7,  $\mathfrak{m}^n = 0$ .

Conversely, we have

$$\mathfrak{m}\subset\mathfrak{N}\subset\bigcap_{ ext{minimal prime ideal}}\mathfrak{p},$$

whence  $\mathfrak{m}$  is minimal.

**Proposition A.3.12.** Let A be a ring. Then A is artinian iff A is of finite length.

*Proof.* First we show that A has only finite maximal ideal. Otherwise, consider the set  $\{\mathfrak{m}_1 \cap \mathfrak{m}_2 \cap \cdots \cap \mathfrak{m}_k\}$ . It has a minimal element  $\mathfrak{m}_1 \cap \cdots \cap \mathfrak{m}_n$  and for any maximal ideal  $\mathfrak{m}$ ,  $\mathfrak{m}_1 \cap \cdots \cap \mathfrak{m}_n \subset \mathfrak{m}$ . It follows that  $\mathfrak{m} = \mathfrak{m}_i$  for some i. Let  $\mathfrak{M} = \mathfrak{m}_1 \cap \cdots \cap \mathfrak{m}_n$  be the Jacobi radical of A. Consider the sequence  $\mathfrak{M} \supset \mathfrak{M}^2 \supset \cdots$  and by Nakayama's Lemma, we have  $\mathfrak{M}^k = 0$  for some k. Consider the filtration

$$A \supset \mathfrak{m}_1 \supset \cdots \supset \mathfrak{m}_1^k \supset \mathfrak{m}_1^k \mathfrak{m}_2 \supset \cdots \supset \mathfrak{m}_1^k \cdots \mathfrak{m}_n^k = (0).$$

We have  $\mathfrak{m}_1^k \cdots \mathfrak{m}_i^j/\mathfrak{m}_1^k \cdots \mathfrak{m}_i^{j+1}$  is an  $A/\mathfrak{m}_i$ -vector space. It is artinian and then of finite length. Hence A is of finite length.

**Theorem A.3.13.** Let A be a ring. Then A is artinian iff A is noetherian and of dimension 0.

*Proof.* Suppose A is artinian. Then A is noetherian by Proposition A.3.12. Let  $\mathfrak{p} \in \operatorname{Spec} A$ . Then  $A/\mathfrak{p}$  is an artinian integral domain. If there is  $a \in A/\mathfrak{p}$  is not invertible, consider  $(a) \supset (a^2) \supset \cdots$ , we see a = 0. Hence  $\mathfrak{p}$  is maximal and dim A = 0.

Suppose that A is noetherian and of dimension 0. Then every maximal ideal is minimal. In particular, A has only finite maximal ideal  $\mathfrak{p}_1, \dots, \mathfrak{p}_n$ . Let  $\mathfrak{q}_i$  be the  $\mathfrak{p}_i$ -component of (0). Then we

have  $A \hookrightarrow \bigoplus_i A/\mathfrak{q}_i$ . We just need to show that  $A/\mathfrak{q}_i$  is of finite length as A-module. If  $\mathfrak{q}_i \subset \mathfrak{p}_j$ , take radical we get  $\mathfrak{p}_i \subset \mathfrak{q}_j$  and hence i = j. So  $A/\mathfrak{q}_i$  is a local ring with maximal ideal  $\mathfrak{p}_i A/\mathfrak{q}_i$ . Then every element in  $\mathfrak{p}_i A/\mathfrak{q}_i$  is nilpotent. Since  $\mathfrak{p}_i$  is finitely generated,  $(\mathfrak{p}_i A/\mathfrak{q}_i)^k = 0$  for some k. Then  $A/\mathfrak{q}_i$  is artinian and then of finite length as  $A/\mathfrak{q}_i$ -module. Then the conclusion follows.

### A.3.2 Dedekind Domains

Yang: To be completed

### A.3.3 Krull's Principal Ideal Theorem

**Theorem A.3.14** (Krull's Principal Ideal Theorem). Let A be a noetherian ring. Suppose  $f \in A$  is not a unit. Let  $\mathfrak{p}$  be a minimal prime ideal among those containing f. Then  $\operatorname{ht}(\mathfrak{p}) \leq 1$ .

*Proof.* By replacing A by  $A_{\mathfrak{p}}$ , we may assume A is local with maximal ideal  $\mathfrak{p}$ . Note that A/(f) is artinian since it has only one prime ideal  $\mathfrak{p}/(f)$ .

Let  $\mathfrak{q} \subsetneq \mathfrak{p}$ . Consider the sequence  $\mathfrak{q}^{(1)} \supset \mathfrak{q}^{(2)} \supset \cdots$ , its image in A/(f) is stationary. Then there exists  $n \in \mathbb{Z}_{\geq 0}$  such that  $\mathfrak{q}^{(n)} + (f) = \mathfrak{q}^{(n+1)} + (f)$ . For  $x \in \mathfrak{q}^{(n)}$ , we may write x = y + af for  $y \in \mathfrak{q}^{(n+1)}$ . Then  $af \in \mathfrak{q}^{(n)}$ . Since  $\mathfrak{q}^{(n)}$  is  $\mathfrak{q}$ -primary and  $f \notin \mathfrak{q}$ ,  $a \in \mathfrak{q}^{(n)}$ . Then we get  $\mathfrak{q}^{(n)} = \mathfrak{q}^{(n+1)} + f\mathfrak{q}^{(n)}$ . That is,  $\mathfrak{q}^{(n)}/\mathfrak{q}^{(n+1)} = f\mathfrak{q}^{(n)}/\mathfrak{q}^{(n+1)}$ . Note that  $f \in \mathfrak{p}$ , by Nakayama's Lemma,  $\mathfrak{q}^{(n)} = \mathfrak{q}^{(n+1)}$ . That is,  $\mathfrak{q}^n A_{\mathfrak{q}} = \mathfrak{q}^{n+1} A_{\mathfrak{q}}$ . By Nakayama's Lemma again,  $\mathfrak{q}^n A_{\mathfrak{q}} = 0$ . It follows that  $\mathfrak{q} A_{\mathfrak{q}}$  is minimal, whence  $A_{\mathfrak{q}}$  is artinian. Therefore,  $\mathfrak{q}$  is minimal in A.

Corollary A.3.15. Let A be a noetherian local ring. Suppose  $f \in A$  is not a unit. Then  $\dim A/(f) \ge \dim A - 1$ . If f is not contained in a minimal prime ideal, the equality holds.

*Proof.* Let  $\mathfrak{p}_0 \subsetneq \cdots \subsetneq \mathfrak{p}_n$  be a sequence of prime ideals. By assumption,  $f \in \mathfrak{p}_n$ . If  $f \in \mathfrak{p}_0$ , we get a sequence of prime ideals in A/(f) of length n. Now we suppose  $f \notin \mathfrak{p}_0$ . Then there exists  $k \geq 0$  such that  $f \in \mathfrak{p}_{k+1} \setminus \mathfrak{p}_k$ .

Choose  $\mathfrak{q}$  be a minimal prime ideal among those containing  $(\mathfrak{p}_{k-1}, f)$  and contained in  $\mathfrak{p}_{k+1}$ . Then by Krull's Principal Ideal Theorem A.3.14,  $\mathfrak{q}_k \subsetneq \mathfrak{p}_{k+1}$ . Replace  $\mathfrak{p}_k$  by  $\mathfrak{q}_k$ , we have  $f \in \mathfrak{q}_k \setminus \mathfrak{p}_{k-1}$  Repeat this process, we get a sequence  $\mathfrak{p}'_0 \subsetneq \cdots \subsetneq \mathfrak{p}'_n$  such that  $f \in \mathfrak{p}'_1$ . This gives a sequence  $\mathfrak{p}'_1 \subsetneq \cdots \subsetneq \mathfrak{p}'_n$  in A/(f). Hence we get dim  $A/(f) \geq \dim A - 1$ .

Since f is not contained in minimal prime ideal, preimage of a minimal prime ideal in A/(f) has height 1. Hence a sequence of prime ideals in A/fA can be extended by a minimal prime ideal in A. It follows that  $\dim A/(f)+1 \leq \dim A$ .

**Proposition A.3.16.** Let  $(A, \mathfrak{m})$  be a local noetherian ring with residue field k. Then the following inequalities hold:

$$\operatorname{depth} A \leq \dim A \leq \dim_{\mathsf{k}} T_{A,\mathfrak{m}}.$$

*Proof.* The first inequality is a direct corollary of Corollary A.3.15.

Let  $t_1, \dots, t_n$  be a  $\kappa(\mathfrak{m})$ -basis of  $\mathfrak{m}/\mathfrak{m}^2$ . Then we have  $\mathfrak{m}/(t_1, \dots, t_n) + \mathfrak{m}^2 = 0$ , whence  $\mathfrak{m}/(t_1, \dots, t_n) = \mathfrak{m}(\mathfrak{m}/(t_1, \dots, t_n))$ . It follows that  $\mathfrak{m} = (t_1, \dots, t_n)$  by Nakayama's Lemma. By

Corollary A.3.15,

$$n + \dim A/(t_1, \dots, t_n) \ge n - 1 + \dim A/(t_1, \dots, t_{n-1}) \ge \dots \ge 1 + \dim A/(t_1) \ge \dim A.$$

We conclude the result.

**Definition A.3.17.** Let X be a locally noetherian scheme and  $k \in \mathbb{Z}_{\geq 0}$ . We say that X verifies property  $(R_k)$  or is regular in codimension k if  $\forall \xi \in X$  with codim  $Z_{\xi} \leq k$ ,

$$\dim_{\kappa(\xi)} T_{X,\xi} = \dim \mathcal{O}_{X,\xi}.$$

We say that X verifies property  $(S_k)$  if  $\forall \xi \in X$  with depth  $\mathcal{O}_{X,\xi} < k$ ,

$$\operatorname{depth} \mathcal{O}_{X,\xi} = \dim \mathcal{O}_{X,\xi}.$$

**Example A.3.18.** Let A be a noetherian ring. Then A verifies  $(S_1)$  iff A has no embedded point.

Suppose A verifies  $(S_1)$ . If  $\mathfrak{p} \in \operatorname{Ass} A$ , every element in  $\mathfrak{p}$  is a zero divisor. Then depth  $A_{\mathfrak{p}} = 0$ . It follows that dim  $A_{\mathfrak{p}} = 0$  and then  $\mathfrak{p}$  is minimal.

Suppose A has no embedded point. Let  $\mathfrak{p} \in \operatorname{Spec} A$  with depth  $A_{\mathfrak{p}} = 0$ . This means every element in  $\mathfrak{p}A_{\mathfrak{p}}$  is a zero divisor. Then

$$\mathfrak{p} \subset \{\text{zero divisors in } A\} = \bigcup_{\text{minimal prime ideals}} \mathfrak{q}.$$

By Proposition A.1.2,  $\mathfrak{p} = \mathfrak{q}$  for some minimal  $\mathfrak{q}$ , whence dim  $A_{\mathfrak{p}} = 0$ .

**Example A.3.19.** Let A be a noetherian ring. Then A is reduced iff it verifies  $(R_0)$  and  $(S_1)$ .

Suppose A is reduced. Let  $\mathfrak{p}_1, \dots, \mathfrak{p}_n$  be all minimal prime ideals of A. We have  $\bigcap \mathfrak{p}_i = \mathfrak{N} = (0)$ , where  $\mathfrak{N}$  is the nilradical of A. Hence A has no embedded point. Since  $A_{\mathfrak{p}}$  is artinian, local and reduced,  $A_{\mathfrak{p}}$  is a field and hence regular.

Conversely, let Ass A be equal to  $\{\mathfrak{p}_1, \dots, \mathfrak{p}_n\}$ . Then every  $\mathfrak{p}_i$  is minimal by  $(S_1)$ . Let f be in  $\mathfrak{N}$ . Then the image of f in  $A_{\mathfrak{p}_i}$  is 0 since by  $(R_0)$ ,  $A_{\mathfrak{p}_i}$  is a field. It follows that  $f \in \mathfrak{q}_i$ , where  $\mathfrak{q}_i$  is the  $\mathfrak{p}_i$  component of (0) in A. Hence  $f \in \bigcap \mathfrak{q}_i = (0)$ . That is, A is reduced.

### A.3.4 Cohen-Macaulay rings

**Definition A.3.20** (Cohen-Macaulay). A noetherian local ring  $(A, \mathfrak{m})$  is called *Cohen-Macaulay* if dim  $A = \operatorname{depth} A$ . A noetherian ring A is called *Cohen-Macaulay* if for every prime ideal  $\mathfrak{p} \in \operatorname{Spec} A$ , the localization  $A_{\mathfrak{p}}$  is Cohen-Macaulay. This is equivalent to that A verifies  $(S_k)$  for all  $k \geq 0$ .

**Example A.3.21** (Non Cohen-Macaulay rings). Yang: To be completed.

Corollary A.3.22. Let A be a noetherian ring, M a finite A-module and  $a \in A$  an M-regular element. Then depth  $M = \operatorname{depth} M/aM + 1$ .

Corollary A.3.23. Let A be a noetherian ring  $a \in A$  a nonzero divisor. Then A verifies  $(S_d)$  iff A/aA verifies  $(S_{d-1})$ .

**Definition A.3.24.** An ideal I of a noetherian ring A is called *unmixed* if

$$ht(I) = ht(\mathfrak{p}), \quad \forall \mathfrak{p} \in Ass(A/I).$$

Here ht(I) is defined as

$$\operatorname{ht}(I) := \inf\{\operatorname{ht}(\mathfrak{p}) : I \subset \mathfrak{p}\}.$$

We say that the unmixedness theorem holds for a noetherian ring A if any ideal  $I \subset A$  generated by  $\operatorname{ht}(I)$  elements is unmixed. We say that the unmixedness theorem holds for a locally noetherian scheme X if  $\mathcal{O}_{X,\xi}$  is unmixed for any point  $\xi \in X$ .

**Theorem A.3.25.** Let X be a locally noetherian scheme. Then the unmixedness theorem holds for X if and only if X is Cohen-Macaulay.

*Proof.* We can assume that  $X = \operatorname{Spec} A$  is affine.

Suppose X is Cohen-Macaulay. Let  $I \subset A$  be an ideal generated by  $a_1, \dots, a_r$  with  $r = \operatorname{ht}(I)$ . We claim that  $a_1, \dots, a_r$  is an A-regular sequence. If so, we get that the unmixedness theorem holds for A by applying Example A.3.18 on A/I. Since  $\operatorname{ht}(a_1, \dots, a_{r-1}) \leq r-1$  by Krull's Principal Ideal Theorem A.3.14 and  $\operatorname{ht}(a_1, \dots, a_r) = r \leq \operatorname{ht}(a_1, \dots, a_{r-1}) + 1$ , we have  $\operatorname{ht}(a_1, \dots, a_{r-1}) = r-1$ . By induction on r, we can assume that  $a_1, \dots, a_{r-1}$  is an A-regular sequence. Hence any prime ideal  $\mathfrak{p} \in \operatorname{Ass} A/(a_1, \dots, a_{r-1})$  has height r-1. Now suppose  $a_r$  is a zero divisor in  $A/(a_1, \dots, a_{r-1})$ . Then there exists a prime ideal  $\mathfrak{p} \in \operatorname{Ass} A/(a_1, \dots, a_{r-1})$  such that  $a_r \in \mathfrak{p}$ . Then  $I \subset \mathfrak{p}$  and  $\operatorname{ht}(I) \leq r-1$ . This contradicts that  $\operatorname{ht}(I) = r$ .

Suppose the unmixedness theorem holds for A. Let  $\mathfrak{p} \in \operatorname{Spec} A$  be a prime ideal with  $\operatorname{ht}(\mathfrak{p}) = r$ . Then  $\mathfrak{p} \in \operatorname{Ass} A$  if and only if  $\operatorname{ht}(\mathfrak{p}) = 0$ . If r > 0, there is a nonzero divisor  $a \in \mathfrak{p}$ . By Krull's Principal Ideal Theorem A.3.14,  $\operatorname{ht}(\mathfrak{p}A/aA) = r - 1$ . Inductively, we can find a regular sequence  $a_1, \dots, a_r$  in  $\mathfrak{p}$ . Then depth  $A_{\mathfrak{p}} = r$ .

**Theorem A.3.26.** Let X be a locally noetherian scheme. Suppose that X is Cohen-Macaulay. Let  $F \subset X$  be a closed subset of codimension  $\geq k$ . Then the restriction  $H^i(X, \mathcal{O}_X) \to H^i(X \setminus F, \mathcal{O}_X)$  is an isomorphism.

Proof. Yang: To be completed.

### A.3.5 Regular rings

**Definition A.3.27.** A noetherian ring A is said to be regular at  $\mathfrak{p} \in \operatorname{Spec} A$  if we have

$$\dim_{\kappa(\mathfrak{p})} T_{A,\mathfrak{p}} = \dim A_{\mathfrak{p}},$$

where dim  $A_{\mathfrak{p}}$  is the Krull dimension of the local ring  $A_{\mathfrak{p}}$ .

A noetherian ring A is said to be regular if it is regular at every prime ideal  $\mathfrak{p} \in \operatorname{Spec} A$ . This is equivalent to the condition that A verifies  $(R_k)$  for all  $k \geq 0$ .

**Remark A.3.28.** A noetherian ring A is regular if and only if it is regular at every maximal ideal  $\mathfrak{m} \in \mathrm{mSpec}\,A$ . The proof uses homological tools; see Theorem B.3.17 and Corollary B.3.18.

**Definition A.3.29.** Let A be a noetherian ring that is regular at  $\mathfrak{p} \in \operatorname{Spec} A$ . A sequence  $t_1, \dots, t_n \in \mathfrak{p}$  is called a *regular system of parameters* at  $\mathfrak{p}$  if their images form a basis of the  $\kappa(\mathfrak{p})$ -vector space  $\mathfrak{p}/\mathfrak{p}^2$ .

**Proposition A.3.30.** Let  $(A, \mathfrak{m})$  be a noetherian local ring that is regular at  $\mathfrak{m}$ . Let  $t_1, \dots, t_n$  be a regular system of parameters at  $\mathfrak{m}$ ,  $\mathfrak{p}_i = (t_1, \dots, t_i)$  and  $\mathfrak{p}_0 = (0)$ . Then  $\mathfrak{p}_i$  is a prime ideal of height i, and  $A/\mathfrak{p}_i$  is a regular local ring for all i. In particular, regular local ring is integral, and the regular system of parameters  $t_1, \dots, t_n$  is a regular sequence in A.

*Proof.* By the Krull's Principal Ideal Theorem A.3.14, we have

14

$$n-1 = \dim A - 1 \le \dim A/(t_1) \le \dim_{\kappa(\mathfrak{m}/(t_1))} T_{A/(t_1),\mathfrak{m}/(t_1)} \le n-1.$$

Hence dim  $A/(t_1) = n - 1$  and ht $(t_1) = 1$ . Since  $t_2, \dots, t_n$  generate  $\mathfrak{m}/(t_1)$ , we have that  $A/(t_1)$  is regular at  $\mathfrak{m}/(t_1)$  and the images of  $t_2, \dots, t_n$  form a regular system of parameters.

For integrality, we induct on the dimension of A. If  $\dim A = 0$ , then A is a field and hence integral. Suppose  $\dim A > 0$ , let  $\mathfrak{q}$  be a minimal prime ideal of A. Then  $t_1 \notin \mathfrak{q}$ . We have

$$n-1 = \dim A - 1 \le \dim A/(\mathfrak{q} + t_1 A) \le \dim_{\kappa(\mathfrak{q}/(t_1))} T_{A/(\mathfrak{q}+t_1 A),\mathfrak{q}/(t_1)} \le n-1.$$

By similar arguments, we have  $A/(\mathfrak{q}+t_1A)$  is regular at  $\mathfrak{m}/(\mathfrak{q}+t_1A)$ . By induction hypothesis, both of  $A/t_1A$  and  $A/(\mathfrak{q}+t_1A)$  are integral and of dimension n-1. Hence  $t_1A=t_1A+\mathfrak{q}$ , i.e.  $\mathfrak{q}\subset t_1A$ . For every  $a=bt_1\in\mathfrak{q}$ , we have  $b\in\mathfrak{q}$  since  $t_1\notin\mathfrak{q}$ . Then  $\mathfrak{q}\subset t_1\mathfrak{q}\subset\mathfrak{mq}$ . By Nakayama's Lemma,  $\mathfrak{q}=0$ , whence A is integral.

Corollary A.3.31. A regular noetherian ring is Cohen-Macaulay.

Corollary A.3.32. A regular noetherian ring is normal.

Remark A.3.33. Indeed we can show a stronger result: a noetherian regular local ring is a UFD; see Yang: ref.

### A.4 Finite Algebra and Normality

Let R be a ring and A be an R-algebra. We say that A is of finite type over R if there exists a surjective R-algebra homomorphism  $R[T_1, \dots, T_n] \to A$  for some  $n \ge 0$ . We say that A is finite over R if it is finite as an R-module.

### A.4.1 Finite algebra

Let A be a ring and B a finite A-algebra.

**Example A.4.1.** Let K be a number field. Then  $O_K$  is a finite  $\mathbb{Z}$ -algebra. Yang: To be completed.

**Lemma A.4.2.** Let  $A \subset B$  be noetherian rings such that B is finite over A. Then the induced morphism Spec  $B \to \operatorname{Spec} A$  is surjective.

Proof. For  $\mathfrak{p} \in \operatorname{Spec} A$ , let  $S := A - \mathfrak{p}$  and denote  $S^{-1}B$  by  $B_{\mathfrak{p}}$ . Then we have  $A_{\mathfrak{p}} \hookrightarrow B_{\mathfrak{p}}$  and  $B_{\mathfrak{p}}$  is finite over  $A_{\mathfrak{p}}$ . Let  $\mathfrak{P}B_{\mathfrak{p}}$  be a maximal ideal of  $B_{\mathfrak{p}}$ . We claim that  $\mathfrak{P}B_{\mathfrak{p}} \cap A_{\mathfrak{p}}$  is maximal. Indeed, consider  $A_{\mathfrak{p}}/(\mathfrak{P} \cap A_{\mathfrak{p}}) \hookrightarrow B_{\mathfrak{p}}/\mathfrak{P}B_{\mathfrak{p}}$ , the latter is finite over the former. This enforces  $A_{\mathfrak{p}}/(\mathfrak{P}B_{\mathfrak{p}} \cap A_{\mathfrak{p}})$  be a field. Hence  $\mathfrak{P}B_{\mathfrak{p}} \cap A_{\mathfrak{p}} = \mathfrak{p}A_{\mathfrak{p}}$ , and then  $\mathfrak{P} \cap A = \mathfrak{p}$ .

**Proposition A.4.3.** Let  $A \subset B$  be noetherian rings such that B is finite over A. Then dim  $A = \dim B$ .

*Proof.* If we have a sequence  $\mathfrak{P}_1 \subsetneq \mathfrak{P}_2$  of prime ideals in B, then there exists  $f \in \mathfrak{P}_2 \setminus \mathfrak{P}_1$ . Since B is finite over A, there exist  $a_1, \dots, a_n \in A$  such that

$$f^n + a_1 f^{n-1} + \dots + a_n = 0.$$

Then  $a_n \in \mathfrak{P}_2 \cap A$ . If  $a_n \in \mathfrak{P}_1$ ,  $f^{n-1} + \cdots + a_{n_1} \in \mathfrak{P}_1$  since  $f \notin \mathfrak{P}_1$ . Then  $a_{n-1} \in \mathfrak{P}_2$ . Repeat the process, it will terminate, whence  $\mathfrak{P}_1 \cap A \subsetneq \mathfrak{P}_2 \cap A$ . Otherwise, we have  $f^n \in a_1B + \cdots + a_nB \subset \mathfrak{P}_1$ .

Conversely, suppose we have  $\mathfrak{p}_1,\mathfrak{p}_2\in\operatorname{Spec} A$  with  $\mathfrak{p}_1\subsetneq\mathfrak{p}_2$ . Choose  $\mathfrak{P}_1\in\operatorname{Spec} B$  such that  $\mathfrak{P}_1\cap A=\mathfrak{p}_1$ , then we have  $A/\mathfrak{p}_1\subset B/\mathfrak{P}_1$ . Let  $\mathfrak{P}_2$  be the preimage of the prime ideal in  $B/\mathfrak{P}_1$  which is over image of  $\mathfrak{p}_2$  in  $A/\mathfrak{p}_1$ . Proposition A.4.2 guarantees that such  $\mathfrak{P}_2$  exists. Then we get  $\mathfrak{P}_1\subsetneq\mathfrak{P}_2$ . Repeat this progress, we get dim  $B\geq\dim A$ .

Yang: To be completed

**Definition A.4.4.** An integral domain A is called *normal* if it is integrally closed in its field of fractions Frac(A).

**Lemma A.4.5.** Let  $A \subset C$  be rings and B the integral closure of A in C, S a multiplicatively closed subset of A. Then the integral closure of  $S^{-1}A$  in  $S^{-1}C$  is  $S^{-1}B$ .

*Proof.* For every  $b \in B$  and  $\forall s \in S$ , there exists  $a_i \in A$  s.t.

$$b^n + a_1 b^{n-1} + \dots + a_n = 0.$$

Then

$$\left(\frac{b}{s}\right)^n + \frac{a_1}{s^1} \left(\frac{b}{s}\right)^{n-1} + \dots + \frac{a_n}{s^n} = 0.$$

Hence b/s is integral over  $S^{-1}A$ ,  $S^{-1}B$  is integral over  $S^{-1}A$ .

If  $c/s \in S^{-1}C$  is integral over  $S^{-1}A$ , then  $\exists a_i \in S^{-1}A$  s.t.

$$\left(\frac{c}{s}\right)^n + a_1 \left(\frac{c}{s}\right)^{n-1} + \dots + a_n = 0.$$

Then

$$c^{n} + a_{1}sc^{n-1} + \dots + a_{n}s^{n} = 0 \in S^{-1}C$$

Then  $\exists t \in S \text{ s.t.}$ 

$$t(c^{n} + a_{1}sc^{n-1} + \dots + a_{n}s^{n}) = 0 \in C.$$

Then

$$(ct)^n + a_1 st(ct)^{n-1} + \dots + a_n s^n t^n = t^n (c^n + a_1 sc^{n-1} + \dots + a_n s^n) = 0.$$

Hence ct is integral over A, then  $ct \in B$ . Then  $c/s = (ct)/(st) \in S^{-1}B$ . This completes the proof.

**Proposition A.4.6.** Normality is a local property. That is, for an integral domain A, TFAE:

- (i) A is normal.
- (ii) For any prime ideal  $\mathfrak{p} \in \operatorname{Spec} A$ , the localization  $A_{\mathfrak{p}}$  is normal.
- (iii) For any maximal ideal  $\mathfrak{m} \in \mathrm{mSpec}\,A$ , the localization  $A_{\mathfrak{m}}$  is normal.

*Proof.* When A is normal,  $A_{\mathfrak{p}}$  is normal by Lemma A.4.5.

Assume that  $A_{\mathfrak{m}}$  is normal for every  $\mathfrak{m} \in \mathrm{mSpec}\,A$ . If A is not normal, let  $\tilde{A}$  be the integral closure of A in Frac A,  $\tilde{A}/A$  is a nonzero A-module. Suppose  $\mathfrak{p} \in \mathrm{Supp}\,\tilde{A}/A$  and  $\mathfrak{p} \subset \mathfrak{m}$ . We have  $\tilde{A}_{\mathfrak{m}}/A_{\mathfrak{m}} = 0$  and  $\tilde{A}_{\mathfrak{p}}/A_{\mathfrak{p}} = (\tilde{A}_{\mathfrak{m}}/A_{\mathfrak{m}})_{\mathfrak{p}} \neq 0$ . This is a contradiction.

**Proposition A.4.7.** Let A be a normal ring. Then A[X] is also normal.

**Definition A.4.8.** A scheme X is called *normal* if the local ring  $\mathcal{O}_{X,\xi}$  is normal for any point  $\xi \in X$ . A ring A is called *normal* if Spec A is normal.

**Remark A.4.9.** For a general ring A, let  $S := A \setminus (\bigcup_{\mathfrak{p} \in \operatorname{Ass} A} \mathfrak{p}) = \bigcap_{\mathfrak{p} \in \operatorname{Ass} A} A \setminus \mathfrak{p}$ . Then S is a multiplicative set. The localization  $S^{-1}A$  is called *the total ring of fractions* of A.

Suppose A is reduced and Ass  $A = \{\mathfrak{p}_1, \dots, \mathfrak{p}_n\}$ . Denote its total ring of fractions by Q. Note that elements in Q are either unit or zero divisor. Hence any maximal ideal  $\mathfrak{m}$  is contained in  $\bigcup \mathfrak{p}_i Q$ , whence contained in some  $\mathfrak{p}_i Q$ . Thus  $\mathfrak{p}_i Q$  are maximal ideals. And we have  $\bigcap \mathfrak{p}_i Q = 0$ . By the Chinese Remainder Theorem, we have  $Q = \prod Q/\mathfrak{p}_i Q = \prod A_{\mathfrak{p}_i}$ .

Let A be a reduced ring with total ring of fractions Q. Then A is normal iff A is integral closed in Q. If A is normal, then for every  $\mathfrak{p} \in \operatorname{Spec} A$ ,  $A_{\mathfrak{p}}$  is integral. Then there is unique minimal prime ideal  $\mathfrak{p}_i \subset \mathfrak{p}$ . In particular, any two minimal prime ideal are relatively prime. By the Chinese Remainder Theorem,  $A = \prod A/\mathfrak{p}_i$ . Just need to check  $A/\mathfrak{p}_i$  is integral closed in  $A_{\mathfrak{p}_i}$ . This is clear by check pointwise.

Conversely, suppose A is integral closed in Q. Let  $e_i$  be the unit element of  $A_{\mathfrak{p}_i}$ . It belongs to A since  $e_i^2 - e_i = 0$ . Since  $1 = e_1 + \cdots + e_n$  and  $e_i e_j = \delta_{ij}$ , we have  $A = \prod A e_i$ . Since  $A e_i$  is integral closed in  $A_{\mathfrak{p}_i}$ , it is normal. Hence A is normal.

**Lemma A.4.10.** Let A be a normal ring. Then A verifies  $(R_1)$  and  $(S_2)$ .

*Proof.* Since all properties are local, we can assume A is integral and local.

For  $(S_2)$ , by Example ??, we only need to show that  $\operatorname{Ass}_A A/f$  has no embedded point. Let

 $\mathfrak{p}=(f:g)=\in \operatorname{Ass}_A A/fA$  and  $t:=f/g\in\operatorname{Frac} A$ . After Replacing A by  $A_{\mathfrak{p}}$ , we can assume that  $\mathfrak{p}$  is maximal. By definition,  $t^{-1}\mathfrak{p}\subset A$ . If  $t^{-1}\mathfrak{p}\subset \mathfrak{p}$ , suppose  $\mathfrak{p}$  is generated by  $(x_1,\cdots,x_n)$  and  $t^{-1}(x_1,\cdots,x_n)^T=\Phi(x_1,\cdots,x_n)^T$  for  $\Phi\in M_n(A)$ . There is a monic polynomial  $\chi(T)\in A[T]$  vanishing  $\Phi$ . Then  $\chi(t^{-1})=0$  and  $t^{-1}\in A$ . This is impossible by definition of t. Then  $t^{-1}\mathfrak{p}=A$ , and  $\mathfrak{p}=(t)$  is principal. By Krull's Principal Ideal Theorem A.3.14,  $\operatorname{ht}(\mathfrak{p})=1$ .

Now we show that A verifies  $(R_1)$ . Suppose  $(A, \mathfrak{m})$  is local of dimension 1. Choosing  $a \in \mathfrak{m}$ , A/a is of dimension 0. Then by A.3.11,  $\mathfrak{m}^n \subset aA$  for some  $n \geq 1$ . Suppose  $\mathfrak{m}^{n-1} \not\subset aA$ . Choose  $b \in \mathfrak{m}^{n-1} \setminus aA$  and let t = a/b. By construction,  $t^{-1} \notin A$  and  $t^{-1}\mathfrak{m} \subset A$ . After similar argument, we see that  $\mathfrak{m} = tA$ , whence A is regular.

**Lemma A.4.11.** Let  $(A, \mathfrak{m})$  be a noetherian local ring of dimension 1. Then A is normal iff A is regular.

*Proof.* By lemma A.4.10, we just need to show that regularity implies normality.

Let  $t \in \mathfrak{m} \setminus \mathfrak{m}^2$ . Since A is regular,  $\mathfrak{m} = (t)$ . Let  $I \subset \mathfrak{m}$  be an ideal. If  $I \subset \bigcap_n \mathfrak{m}^n$ , then for every  $a \in I$ , there exists  $a_n$  such that  $a = a_n t^n$ . Then we get an ascending chain of ideals  $(a_1) \subset (a_2) \subset \cdots$ . Hence a = 0 by Nakayama's Lemma. Suppose I is not zero. Then there is some n such that  $I \subset \mathfrak{m}^n$  and  $I \not\subset \mathfrak{m}^{n+1}$ . For every  $at^n \in I \setminus \mathfrak{m}^{n+1}$ ,  $a \notin \mathfrak{m}$ , whence a is a unit in A. Then  $I = (t^n)$ . Hence A is PID and hence normal.

**Proposition A.4.12.** Let A be a noetherian integral domain of dimension  $\geq 1$  verifying  $(S_2)$ . Then

$$A = \bigcap_{\mathfrak{p} \in \operatorname{Spec} A, \operatorname{ht}(\mathfrak{p}) = 1} A_{\mathfrak{p}}.$$

Proof. Clearly  $A \subset \bigcap A_{\mathfrak{p}}$ . Let  $t = f/g \in \bigcap A_{\mathfrak{p}}$ . Since  $f \in gA_{\mathfrak{p}}$  and we have  $gA = \bigcap (gA_{\mathfrak{p}} \cap A)$ ,  $f \in gA$ . It follows that  $t \in A$ .

**Theorem A.4.13** (Serre's criterion for normality). Let X be a locally noetherian scheme. Then X is normal if and only if it verifies  $(R_1)$  and  $(S_2)$ .

*Proof.* One direction has been proved in Lemma A.4.10. Suppose X verifies  $(R_1)$  and  $(S_2)$ . Again we can assume  $X = \operatorname{Spec} A$  is affine and A is local. By Remark A.4.9, we just need to show that A is integral closed in its total ring of fractions Q. Suppose we have

$$\left(\frac{a}{b}\right)^n + c_1 \left(\frac{a}{b}\right)^{n-1} + \dots + c_n = 0 \in Q.$$

Since A verifies  $(S_2)$ ,  $bA = \bigcap \nu_{\mathfrak{p}}^{-1}(b_{\mathfrak{p}}A_{\mathfrak{p}})$ . So it is sufficient to show that  $a_{\mathfrak{p}} \in b_{\mathfrak{p}}A_{\mathfrak{p}}$  with  $\operatorname{ht}(\mathfrak{p}) = 1$ . Note that  $A_{\mathfrak{p}}$  is regular and hence normal by Lemma A.4.11. Then above equation gives us desired result.

### A.5 Smoothness

### A.5.1 Modules of differentials and derivations

In this subsection, let R be a ring and A an R-algebra.

**Definition A.5.1** (Derivation). A derivation of A over R is an R-linear map  $\partial: A \to M$  with an A-module such that for all  $a, b \in A$ , we have

$$\partial(ab) = a\partial(b) + b\partial(a).$$

Given the module M, the set of all derivations of A over R into M forms an A-module, denoted by  $\mathrm{Der}_R(A,M)$ .

Given a module homomorphism  $f: M \to N$  of A-modules and a derivation  $\partial \in \operatorname{Der}_R(A, M)$ , the map  $f \circ \partial$  is a derivation of A over R into N.

**Proposition A.5.2.** The functor  $Der_R(A, -)$  is representable. The representing object is denoted by  $\Omega_{A/R}$ , which is called the *module of differentials* of A over R.

*Proof.* First suppose A is a free R-algebra with a set of generators  $a_{\lambda}, \lambda \in \Lambda$ . Then an R-derivation  $\partial \in \operatorname{Der}_{R}(A, M)$  is uniquely determined by its values on the generators  $a_{\lambda}$ . Let

$$\Omega_{A/R} := \bigoplus_{\lambda \in \Lambda} A \cdot da_{\lambda}$$

and  $d: A \to \Omega_{A/R}$  be the R-derivation defined by  $a_{\lambda} \mapsto da_{\lambda}$ . For any R-derivation  $\partial \in \operatorname{Der}_{R}(A, M)$ , we can define a unique A-module homomorphism  $\Phi_{\partial}: \Omega_{A/R} \to M$  by sending  $da_{\lambda}$  to  $\partial(a_{\lambda})$  such that  $\partial = \Phi_{\partial} \circ d$ . This gives a bijection

$$\operatorname{Der}_R(A, M) \cong \operatorname{Hom}_A(\Omega_{A/R}, M), \quad \partial \mapsto \Phi_{\partial}.$$

Now suppose A = F/I is an arbitrary R-algebra, where F is a free R-algebra and I is an ideal of F. Then we can define the module of differentials

$$\Omega_{A/R} := (\Omega_{F/R} \otimes_F A) / \sum_{f \in I} A \cdot df.$$

The R-linear map  $d_A: F \otimes_F A \xrightarrow{d_F} \Omega_{F/R} \otimes_F A \to \Omega_{A/R}$  is a derivation of A over R.

For any R-derivation  $\partial \in \operatorname{Der}_R(A, M)$ , note that  $F \to A \xrightarrow{\partial} M$  is an R-derivation of F over R into M. Then we get an F-module homomorphism  $\Omega_F \to M$ . It gives an A-module homomorphism  $\Omega_F \otimes_F A \to M$ ,  $\mathrm{d} f \otimes 1 \mapsto \partial f$ . This map factors into  $\Omega_F \otimes_F A \to \Omega_{A/R}$  and  $\Phi_{\partial} : \Omega_{A/R} \to M$ . Since  $\Phi_{\partial}$  is A-linear and  $\Omega_{A/R}$  is generated by  $\mathrm{d} a_{\lambda}$  as A-module, such  $\Phi_{\partial}$  is unique.

Corollary A.5.3. Suppose A is of finite type over R. Then the module of differentials  $\Omega_{A/R}$  is a finitely generated A-module.

**Remark A.5.4.** Let B be an A-algebra, M an A-module and N a B-module. If there is a homomorphism of A-modules  $M \to N$ , then we can extend it to a homomorphism of B-modules  $M \otimes_A B \to N$  by sending  $m \otimes b$  to  $m \cdot b$ . And such extension is unique in the sense of following commutative diagram:

$$M \longrightarrow N$$

$$\downarrow \qquad \qquad \downarrow$$

$$M \otimes_A B$$

Hence we get a natural bijection

$$\operatorname{Hom}_A(M,N) \cong \operatorname{Hom}_B(M \otimes_A B, N).$$

**Proposition A.5.5.** Let A, R' be R-algebras and  $A' := A \otimes_R R'$ . Then the module of differentials  $\Omega_{A'/R'}$  is isomorphic to  $\Omega_{A/R} \otimes_A A'$ .

*Proof.* We check the universal property of  $\Omega_{A/R} \otimes_A A'$ . First, the map

$$d_{A'}: A \otimes_R R' \to \Omega_{A/R} \otimes_R R' \cong \Omega_{A/R} \otimes_A A', \quad a \otimes r \mapsto da \otimes r$$

is an R'-derivation of A' into  $\Omega_{A/R} \otimes_A A'$ . For any R'-derivation  $\partial' : A' \to M$  into an A'-module M, we can compose it with the homomorphism  $A' \to A$  and get an R-derivation  $\partial : A \to M$ . By the universal property of  $\Omega_{A/R}$ , there is a unique A-module homomorphism  $\Phi : \Omega_{A/R} \to M$  such that  $\partial = \Phi \circ d_A$ . Then we can extend it to an A'-module homomorphism  $\Phi' : \Omega_{A/R} \otimes_A A' \to M$  by Remark A.5.4. By the construction, we have  $\Phi' \circ d_{A'} = \partial'$ .

**Proposition A.5.6.** Let A be an R-algebra and S a multiplicative set of A. Then we have an isomorphism

$$\Omega_{S^{-1}A/R} \cong S^{-1}\Omega_{A/R}.$$

*Proof.* Let

$$d_{S^{-1}A}: S^{-1}A \to S^{-1}\Omega_{A/R}, \quad \frac{a}{s} \mapsto \frac{sda - ads}{s^2}.$$

By direct computation,  $d_{S^{-1}A}$  is an R-derivation of  $S^{-1}A$  over R into  $S^{-1}\Omega_{A/R}$ . For any R-derivation  $\partial: S^{-1}A \to M$  into an  $S^{-1}A$ -module M, we can get an  $S^{-1}A$ -module homomorphism  $\Phi': S^{-1}\Omega_{A/R} \to M$  as proof of Proposition A.5.5. We have

$$\partial(s \cdot \frac{a}{s}) = s\partial(\frac{a}{s}) + \frac{a}{s}\partial s.$$

It follows that

$$\partial(\frac{a}{s}) = \frac{s\partial a - a\partial s}{s^2} = \frac{s\Phi'(\mathrm{d}a) - a\Phi'(\mathrm{d}s)}{s^2} = \Phi'(\frac{s\mathrm{d}a - a\mathrm{d}s}{s^2}).$$

Thus,  $\Phi' \circ d_{S^{-1}A} = \partial$ .

**Theorem A.5.7.** Let A be an R-algebra and B an A-algebra. Then there is a natural short exact sequence

$$\Omega_{A/R} \otimes_A B \to \Omega_{B/R} \to \Omega_{B/A} \to 0$$

of B-modules.

*Proof.* Let  $d_{A/R}: A \to \Omega_{A/R}$  be the R-derivation of A over R. The map  $A \to B \xrightarrow{d_{B/R}} \Omega_{B/R}$  induces a B-linear map

$$u: \Omega_{A/R} \otimes_A B \to \Omega_{B/R}, \quad d_{A/R}(a) \otimes b \mapsto bd_{B/R}(a).$$

The map  $d_{B/A}$  is an A-derivation and hence R-derivation. Then it induces a B-linear map

$$v: \Omega_{B/R} \to \Omega_{B/A}, \quad d_{B/R}(b) \mapsto d_{B/A}(b).$$

Since  $\Omega_{B/A}$  is generated by elements of the form  $d_{B/A}(b)$  for  $b \in B$ , the map v is surjective. And clearly  $d_{B/A}(a) = ad_{B/A}(1) = 0$  for  $a \in A$ .

Consider the composition  $B \xrightarrow{\mathrm{d}_{B/R}} \Omega_{B/R} \to \Omega_{B/R} / \mathrm{Im} u$ . For every  $a \in A, b \in B$ , we have

$$[d_{B/R}(ab)] = [bd_{B/R}(a) + ad_{B/R}(b)] = [bd_{B/R}(a)] + [ad_{B/A}(b)] = [ad_{B/A}(b)].$$

Hence it is indeed an A-derivation of B. Then it induces a B-linear map

$$\varphi: \Omega_{B/A} \to \Omega_{B/R} / \operatorname{Im} u, \quad d_{B/A}(b) \mapsto [d_{B/R}(b)].$$

The map  $\varphi$  is surjective since  $\Omega_{B/R}$  is generated by elements of the form  $d_{B/R}(b)$  for  $b \in B$ . Note that the composition

$$\Omega_{B/A} \xrightarrow{\varphi} \Omega_{B/R} / \operatorname{Im} u \to \Omega_{B/A} / \operatorname{Ker} v$$

is the identity map. Thus,  $\varphi$  is injective and hence an isomorphism. In particular, we have  $\operatorname{Ker} v = \operatorname{Im} u$ .

**Remark A.5.8.** The exact sequence in Theorem A.5.7 is left exact if and only if every R-derivation of A into B-module extends to an R-derivation of B into B-module.

Yang: To be completed.

**Theorem A.5.9.** Let A be an R-algebra and I an ideal of A. Set B := A/I. Then there is a natural short exact sequence

$$I/I^2 \to \Omega_{A/R} \otimes_A B \to \Omega_{B/R} \to 0$$

of B-modules.

*Proof.* Suppose  $A = F/\mathfrak{b}$  for some free R-algebra F and an ideal  $\mathfrak{b}$  of F. Let  $\mathfrak{a}$  be the preimage of I in F. Let  $d\mathfrak{b}$  (resp.  $d\mathfrak{a}$ ) denote the image of  $\mathfrak{b}$  (resp.  $\mathfrak{a}$ ) in  $\Omega_{F/R}$ . Then we have

$$\Omega_{A/R} \otimes_A B = \Omega_{F/R} \otimes_F B/(\mathrm{d}\mathfrak{b} \otimes_F B), \quad \Omega_{B/R} = \Omega_{F/R} \otimes_F B/(\mathrm{d}\mathfrak{a} \otimes_F B).$$

Clearly

$$I/I^2 \cong (\mathfrak{a}/\mathfrak{b}) \otimes_F B \to (\mathrm{d}\mathfrak{a} \otimes_F B)/(\mathrm{d}\mathfrak{b} \otimes_F B)$$

is surjective. Then the exact sequence follows.

**Definition A.5.10.** Let k be a field and A an integral k-algebra of finite type of dimension n. We say A is smooth at  $\mathfrak{p} \in \operatorname{Spec} A$  if the module of differentials  $\Omega_{A,\mathfrak{p}}$  is a free  $A_{\mathfrak{p}}$ -module of rank n.

**Example A.5.11.** Let K/k be a finite generated field extension and k' be the algebraic closure of k in K. Then

$$\dim_{\mathsf{K}} \Omega_{\mathsf{K}/\mathsf{k}} = \operatorname{trdeg}(\mathsf{K}/\mathsf{k}) + \dim_{\mathsf{k}'} \Omega_{\mathsf{k}'/\mathsf{k}},$$

and  $\dim_{\mathbf{k}'} \Omega_{\mathbf{k}'/\mathbf{k}} = 0$  if and only if  $\mathbf{k}'$  is separable over  $\mathbf{k}$ .

First suppose K = k' is algebraic over k. Suppose k'/k is separable. For every  $\alpha \in k'$ , suppose  $f(\alpha) = 0$  for  $f \in k[T]$ . Then  $df(\alpha) = f'(\alpha)d\alpha = 0$ . By the separability of k'/k, we have  $f'(\alpha) \neq 0$ . It follows that  $d\alpha = 0$ . Conversely, let  $\alpha \in k'$  be a inseparable element over k. Since  $k[\alpha] \to k[\alpha], \alpha^n \mapsto n\alpha^{n-1}$  is a non-zero R-derivation, we have  $\Omega_{k[\alpha]/k} \neq 0$ . By induction on number of generated elements, choosing a middle field  $k \subset k'' \subset k'$ , at least one of  $\Omega_{k''/k}$  and  $\Omega_{k'/k''}$  is non-zero. Then  $\Omega_{K/k} \neq 0$  by Theorem A.5.7.

Then suppose k' = k. By the Noether's Normalization Lemma, we can find a finite set of elements  $T_1, \dots, T_n \in K$  such that K is algebraic over  $k'(T_1, \dots, T_n)$ . Note that we can choose  $T_i$  such that  $K/k'(T_1, \dots, T_n)$  is separable. To see this, if  $\alpha \in K$  is an inseparable element over  $k'(T_1, \dots, T_n)$ , then by replacing a suitable  $T_i$  with  $\alpha$ , we reduce the inseparable degree of  $K/k'(T_1, \dots, T_n)$ .

Since  $K/k'(T_1, \dots, T_n)$  is finite, every k-derivation of  $k'(T_1, \dots, T_n)$  into K-module extends to a k-derivation of K into K-module. Then by Remark A.5.8, we have

$$0 \to \Omega_{\mathsf{k}'(T_1,\cdots,T_n)/\mathsf{k}} \otimes_{\mathsf{k}'(T_1,\cdots,T_n)} \mathsf{K} \to \Omega_{\mathsf{K}/\mathsf{k}} \to \Omega_{\mathsf{K}/\mathsf{k}'(T_1,\cdots,T_n)} \to 0.$$

Finally, note that every k-derivation  $\partial$  of k' into K-module can be extended to  $\mathsf{k}'[T_1, \dots, T_n]$  by setting  $\partial T_i = 0$ . Thus, we have

$$0 \to \Omega_{\mathbf{k}'/\mathbf{k}} \otimes_{\mathbf{k}'} \mathbf{k}'[T_1, \cdots, T_n] \to \Omega_{\mathbf{k}'[T_1, \cdots, T_n]/\mathbf{k}} \to \Omega_{\mathbf{k}'[T_1, \cdots, T_n]/\mathbf{k}'} \to 0.$$

This follows that

$$\dim_{\mathsf{K}} \Omega_{\mathsf{K}/\mathsf{k}} = \dim_{\mathsf{K}} \Omega_{\mathsf{K}/\mathsf{k}'} + \dim_{\mathsf{k}'} \Omega_{\mathsf{k}'/\mathsf{k}}.$$

### A.5.2 Applications to affine varieties

Let k be arbitrary field,  $A = k[T_1, \ldots, T_n]$  and  $\mathfrak{m}$  a maximal ideal of A such that  $\kappa(\mathfrak{m})$  is separable over k. We try to give an explanation of Zariski's tangent space at  $\mathfrak{m}$  using the language of derivation. We know that  $\Omega_{A/k} = \bigoplus_{i=1}^n A dT_i$ , thus  $\Omega_{A_{\mathfrak{m}}/k} \cong \bigoplus_{i=1}^n A_{\mathfrak{m}} dT_i$ . Then

$$\mathrm{Der}_{\mathsf{k}}(A_{\mathfrak{m}},A_{\mathfrak{m}}) \cong \mathrm{Hom}_{\mathsf{k}}(\Omega_{A_{\mathfrak{m}}/\mathsf{k}},A_{\mathfrak{m}}) \cong \bigoplus_{i=1}^{n} A_{\mathfrak{m}} \partial_{i},$$

where  $\partial_i \in \operatorname{Der}_{\mathsf{k}}(A_{\mathfrak{m}}, A_{\mathfrak{m}})$  is the derivation defined by  $\mathrm{d}T_i \mapsto 1$  and  $\mathrm{d}T_j \mapsto 0$  for  $j \neq i$ . It coincides with the usual derivation  $f \mapsto \partial f/\partial T_i$ . Consider the restriction of  $\partial_i$  to  $\mathfrak{m}$  and take values in the residue field  $\kappa(\mathfrak{m})$ , we get

$$\Phi:\mathfrak{m}\xrightarrow{(\partial_1,\cdots,\partial_n)^T}A^n_{\mathfrak{m}}\to\kappa(\mathfrak{m})^n.$$

Since  $\kappa(\mathfrak{m})$  is separable over k, we claim that  $\operatorname{Ker} \Phi = \mathfrak{m}^2$ . Indeed, by Remark A.5.12, we can write every  $f \in \mathfrak{m} \setminus \mathfrak{m}^2$  as  $\sum_i a_i g_i$ . Then

$$\frac{\partial f}{\partial T_i} = a_i \frac{\partial g_i}{\partial T_i} + g_i \frac{\partial a_i}{\partial T_i}.$$

Since  $g_i$  is separable, the image of  $\partial g_i/\partial T_i$  in  $\kappa(\mathfrak{m})$  is not zero. Hence  $\Phi(f) \neq 0$ . By the claim,  $\Phi$  induces an isomorphism  $\mathfrak{m}/\mathfrak{m}^2 \cong \kappa(\mathfrak{m})^n$  of  $\kappa(\mathfrak{m})$ -vector spaces. Then we get

$$T_{A,\mathfrak{m}} = (\mathfrak{m}/\mathfrak{m}^2)^{\vee} \cong \bigoplus_{i=1}^n \kappa(\mathfrak{m}) \cdot \partial_i|_x,$$

where  $x \in \mathbb{A}^n_k$  is the point corresponding to  $\mathfrak{m}$ . This coincides with the usual tangent space at x in language of differential geometry.

**Remark A.5.12.** Let k be arbitrary field,  $A = \mathsf{k}[T_1, \dots, T_n]$  and  $g_i$  irreducible polynomials in one variable  $T_i$  over k. Then for every  $f \in A$ , we can write

$$f = \sum_{I=(i_1,\dots,i_n)\in\mathbb{Z}_{>0}^n} a_I g_1^{i_1} \dots g_n^{i_n}, \quad a_I \in A, \quad \deg_{T_i} a_I \le \deg g_i.$$

This is called the Taylor expansion of f with respect to  $g_1, \dots, g_n$ .

When n=1, it follows from division algorithm. For n>1, we can use induction on n. Let  $\mathsf{K}=\mathsf{k}(T_1,\cdots,T_{n-1})$ . Then we can write f as

$$f = \sum_{i=0}^{r} a_i g_n^i, \quad a_i \in \mathsf{K}[T_n], \quad \deg a_i < \deg g_n.$$

Comparing the coefficients of two sides from the highest degree of  $T_n$  to the lowest degree, we see that

$$a_i \in \mathsf{k}[T_1, \cdots, T_{n-1}].$$

By induction hypothesis, the conclusion follows.

Let B = A/I be a k of finite type,  $I = (F_1, \dots, F_m) \subset \mathfrak{m}$  and  $\mathfrak{n}$  the image of  $\mathfrak{m}$  in B. We have an exact sequence of  $\kappa(\mathfrak{m})$ -vector spaces

$$0 \to I/(I \cap \mathfrak{m}^2) \to \mathfrak{m}/\mathfrak{m}^2 \to \mathfrak{n}/\mathfrak{n}^2 \to 0.$$

It induces an isomorphism

$$T_{B,n} \cong \{ \partial \in T_{A,m} \colon \partial(f) = 0, \forall f \in I \}.$$

The Jacobian matrix of  $F_1, \ldots, F_m$  is the  $m \times n$  matrix

$$J(F_1, \dots, F_m) := \left(\frac{\partial F_i}{\partial T_j}\right)_{1 \le i \le m, 1 \le j \le m}$$

with entries in B.

**Theorem A.5.13.** Setting as above. Then B is regular at  $\mathfrak{n}$  if and only if the Jacobian matrix J has maximal rank  $n - \dim B_{\mathfrak{n}}$  after taking values in the residue field  $\kappa(\mathfrak{m})$ .

*Proof.* We have an exact sequence

$$0 \to T_{B,n} \to T_{A,m} \xrightarrow{\Psi} \kappa^m \to 0,$$

where  $\Psi$  sends  $\partial \in T_{A,\mathfrak{m}}$  to  $(\partial(F_1),\ldots,\partial(F_m))^T$ . Note that the matrix of  $\Psi$  is just  $J^T$ , the transpose of the Jacobian matrix. Hence

$$\operatorname{rank} J = n - \dim_{\kappa} T_{B,n} \le n - \dim B_{n}$$

and the equality holds if and only if B is regular at  $\mathfrak{n}$ .

**Remark A.5.14.** If  $\kappa(\mathfrak{m})$  is not separable over k, then we still have the inequality

$$\operatorname{rank} J \le n - \dim B_{\mathfrak{n}}.$$

Indeed, in any case, we have an exact sequence

$$0 \to I/(I \cap \mathfrak{m}^2) \to \mathfrak{m}/\mathfrak{m}^2 \to \mathfrak{n}/\mathfrak{n}^2 \to 0.$$

Hence  $\dim_{\kappa} I/(I \cap \mathfrak{m}^2) = n - \dim B_{\mathfrak{n}}$ . There is a  $\kappa(\mathfrak{m})$ -linear map

$$I/(I \cap \mathfrak{m}^2) \to \kappa(\mathfrak{m})^n, \quad [f] \mapsto (\partial_1(f), \dots, \partial_n(f))^T,$$

and every row of the Jacobian matrix J is in the image of this map. Thus, the rank of J is at most  $n - \dim B_n$ .

Hence if rank  $J = n - \dim B_{\mathfrak{n}}$ , we can still see that B is regular at  $\mathfrak{n}$ . However, the converse does not hold in general.

**Proposition A.5.15.** Let k be a field, k the algebraic closure of k, A a k-algebra of finite type and  $A_{\mathbf{k}} := A \otimes_{\mathbf{k}} \mathbf{k}$ . Yang: Suppose  $A_{\mathbf{k}}$  is integral. Let  $\mathfrak{m} \in \mathrm{mSpec}\,A$  and  $\mathfrak{m}'$  be a maximal ideal of  $A_{\mathbf{k}}$  lying over  $\mathfrak{m}$ . Then

- (a) If  $A_{\mathbf{k}}$  is regular at  $\mathfrak{m}'$ , then A is regular at  $\mathfrak{m}$ ;
- (b) suppose  $\kappa(\mathfrak{m})$  is separable over k, the converse holds.

Proof. Regarding  $J_{\mathfrak{m}}$  and  $J_{\mathfrak{m}'}$  as matrices with entries in  $\mathbf{k}$ , they are the same and hence have the same rank. If  $A_{\mathbf{k}}$  is regular at  $\mathfrak{m}'$ , since  $\kappa(\mathfrak{m}) = \mathbf{k}$ , then rank  $J_{\mathfrak{m}'} = n - \dim A_{\mathbf{k},\mathfrak{m}'}$ . Note that  $\dim A_{\mathbf{k},\mathfrak{m}'} = \operatorname{trdeg}(\mathscr{K}(A_{\mathbf{k}})/\mathbf{k}) = \operatorname{trdeg}(\mathscr{K}(A)/\mathbf{k}) = \dim A_{\mathfrak{m}}$ , we have rank  $J_{\mathfrak{m}} = n - \dim A_{\mathfrak{m}}$ . Hence A is regular at  $\mathfrak{m}$ .

Conversely, suppose A is regular at  $\mathfrak{m}$  and  $\kappa(\mathfrak{m})$  is separable over k. Then rank  $J_{\mathfrak{m}} = n - \dim A_{\mathfrak{m}}$ . Hence  $A_k$  is regular at  $\mathfrak{m}'$ . Yang: To be modified.

**Proposition A.5.16.** Let k be a field and A an integral k-algebra of finite type and of dimension n. Let k be the algebraic closure of k and  $A_k := A \otimes_k k$ . Then A is smooth at  $\mathfrak{p} \in \operatorname{Spec} A$  if and only if  $A_k$  is regular at every  $\mathfrak{m}'$  over  $\mathfrak{m}$ .

Proof. Since  $\Omega_{A_{\mathbf{k}}/\mathbf{k}} \cong \Omega_{A/\mathbf{k}} \otimes_A A_{\mathbf{k}}$  is free of rank n if and only if  $\Omega_{A/\mathbf{k}}$  is free of rank n, we can assume that  $\mathbf{k} = \mathbf{k}$ . If A is smooth at  $\mathfrak{p}$ , then  $\Omega_{A_{\mathfrak{p}}/\mathbf{k}} \cong \bigoplus A_{\mathfrak{p}} \mathrm{d} f_i$  is free of rank n. Let  $\mathfrak{P}_i \in \mathrm{Der}_{\mathbf{k}}(A_{\mathfrak{m}}, A_{\mathfrak{m}})$  be the derivation defined by  $\mathrm{d} f_i \mapsto 1$  and  $\mathrm{d} T_j \mapsto 0$  for  $j \neq i$ . Then we have  $\partial_i f_j = \delta_{ij}$  for  $1 \leq i, j \leq n$ . Then similar to above argument, we have an isomorphism

$$\mathfrak{m}/\mathfrak{m}^2 \xrightarrow{(\partial_1,\ldots,\partial_n)^T} \mathbf{k}^n.$$

This shows that  $A_k$  is regular at  $\mathfrak{m}$ .

Conversely, suppose  $A_{\mathbf{k}}$  is regular at  $\mathfrak{m}$ . Note that  $\mathfrak{m}/\mathfrak{m}^2 \to \Omega_{A,\mathbf{k}} \otimes_A \mathbf{k}$  is surjective since  $\Omega_{A_{\mathbf{k}}/\mathbf{k}} = 0$ . Then by Nakayama's lemma,  $\Omega_{A_{\mathbf{m}}/\mathbf{k}}$  is generated by n elements as an  $A_{\mathfrak{m}}$ -module.

Note that  $\dim_{\mathcal{K}(A)} \Omega_{\mathcal{K}(A)/k} = \operatorname{trdeg}(\mathcal{K}(A)/k) = \dim A_{\mathfrak{m}} = n$ . Yang: By induction on transcendental degree.

Yang: By Nakayama's Lemma,  $\Omega_{A_{\mathfrak{m}}/k}$  is free of rank n as an  $A_{\mathfrak{m}}$ -module.

Yang: To be completed.

**Example A.5.17.** Let  $\mathsf{k}$  be an imperfect field of characteristic p > 2. Suppose  $\alpha = \beta^p \in \mathsf{k}$  and  $\beta$  is not in  $\mathsf{k}$ . Let  $A = \mathsf{k}[x,y]/(x^2 - y^p - \alpha)$  and  $\mathfrak{m} = (x,y^p - \alpha) = (x)$ . Note that  $\mathfrak{m}$  is principal, so A is regular at  $\mathfrak{m}$ . However,

$$J_{\mathfrak{m}} = \left(\frac{\partial}{\partial x}(x^2 - y^p - \alpha), \frac{\partial}{\partial y}(y^p - \alpha)\right) = (2x, 0) = (0, 0) \in M_{1 \times 2}(\kappa(\mathfrak{m})).$$

Thus, A is not smooth at  $\mathfrak{m}$ . From the view of differentials, we have

$$\Omega_{A_{\mathfrak{m}}/k} = A_{\mathfrak{m}} dx \oplus A_{\mathfrak{m}} dy / A_{\mathfrak{m}} \cdot x dx = \kappa(\mathfrak{m}) dx \oplus A_{\mathfrak{m}} dy,$$

which is not free as an  $A_{\mathfrak{m}}$ -module.

### A.6 Formal Completion

### A.6.1 Formal completion of rings and modules

**Definition A.6.1.** Let A be a ring and  $\mathcal{T}$  a topology on A. We say that  $(A, \mathcal{T})$  is a topological ring if the operations of addition and multiplication are continuous with respect to the topology  $\mathcal{T}$ . Given a topological ring A. A topological A-module is a pair  $(M, \mathcal{T}_M)$  where M is an A-module and  $\mathcal{T}_M$  is a topology on M such that the addition and scalar multiplication is continuous. The morphisms of topological A-modules are the continuous A-linear maps. They form a category denoted by  $\mathbf{TopMod}_A$ .

**Definition A.6.2.** Let A be a ring, I an ideal of A and M an A-module. The I-adic topology on M is the topology defined by the basis of open sets  $x + I^k M$  for all  $x \in M, k \ge 0$ .

**Example A.6.3.** Let  $A = \mathbb{Z}$  be the ring of integers and p a prime number. The p-adic topology on  $\mathbb{Z}$  is defined by the metric

$$d(x,y) := ||x-y||_p := p^{-v(x-y)},$$

where v is the valuation defined by the ideal  $p\mathbb{Z}$ .

Let M be an A-module equipped with the I-adic topology. Note that M is Hausdorff as a topological space if and only if  $\bigcap_{n>0} I^n M = \{0\}$ . In this case, we say that M is I-adically separated.

When M is I-adically separated, we can see that M is indeed a metric space. Fix  $r \in (0,1)$ . For every  $x \neq y \in M$ , there is a unique  $k \geq 0$  such that  $x - y \in I^k M$  but  $x - y \notin I^{k+1} M$ . We can define a metric on M by

$$d(x,y) \coloneqq r^k$$
.

This metric induces the I-adic topology on M.

To analyze the I-adic separation property of M, the following Artin-Rees Lemma is particularly useful.

**Theorem A.6.4** (Artin-Rees Lemma). Let A be a noetherian ring, I an ideal of A, M a finite A-module and N a submodule of M. Then there exists an integer N such that for all  $n \geq 0$ , we have

$$(I^{N+n}M) \cap N = I^n(I^NM \cap N).$$

*Proof.* Clearly  $I^n(I^NM\cap N)\subset (I^{N+n}M)\cap N$ . Yang: To be completed.

Corollary A.6.5. Let A be a noetherian ring, I an ideal of A, M a finite A-module and N a submodule of M. Then the subspace topology on N induced by  $N \subset M$  coincides with the I-adic topology on N.

Proof. This is a direct consequence of the Artin-Rees Lemma.

Corollary A.6.6. Let A be a noetherian ring, I an ideal of A, and M a finite A-module. Let  $N = \bigcap_{n>0} I^n M$ . Then IN = N. In particular, if  $I \subset rad(A)$ , then M is I-adically separated.

Proof. Yang: To be completed.

**Lemma A.6.7.** Let A be a ring, I an ideal of A and M an A-module. Then the inverse limit

$$\widehat{M} := \underline{\lim}(\cdots \to M/I^nM \to M/I^{n-1}M \to \cdots \to M/IM)$$

exists in the category of A-modules. Moreover,  $\widehat{A}$  is an A-algebra and  $\widehat{M}$  is an  $\widehat{A}$ -module.

*Proof.* Yang: To be completed.

**Definition A.6.8** (Formal Completion). Let A be a ring, I an ideal of A and M an A-module. The formal completion of M with respect to I, denoted by  $\widehat{M}$ , is defined as

$$\widehat{M} := \varprojlim (\cdots \to M/I^nM \to M/I^{n-1}M \to \cdots \to M/IM),$$

where the maps are the natural projections  $M/I^nM \to M/I^{n-1}M$ .

**Example A.6.9.** Let  $A = \mathbb{Z}$  be the ring of integers and  $I = p\mathbb{Z}$ . The formal completion of  $\mathbb{Z}$  with respect to  $p\mathbb{Z}$  is the ring of p-adic integers, denoted by  $\mathbb{Z}_p$ . The elements of  $\mathbb{Z}_p$  can be represented as infinite series of the form

$$a_0 + a_1 p + a_2 p^2 + \cdots,$$

where  $a_i \in \{0, 1, \dots, p-1\}.$ 

**Example A.6.10.** Let R be a ring,  $A = R[X_1, ..., X_n]$  and  $I = (X_1, ..., X_n)$ . The formal completion of A with respect to I is the ring of formal power series  $R[[X_1, ..., X_n]]$ . The elements of  $R[[X_1, ..., X_n]]$  can be represented as infinite series of the form

$$\sum_{i_1, \dots, i_n} a_{i_1, \dots, i_n} X_1^{i_1} \cdots X_n^{i_n},$$

where  $a_{i_1,\dots,i_n} \in R$  and the multi-index  $(i_1,\dots,i_n)$  runs over all non-negative integers.

**Proposition A.6.11.** The formal completion  $\widehat{A}$  of a ring A with respect to an ideal I is a complete topological ring with respect to the I-adic topology. That is, every Cauchy sequence in  $\widehat{A}$  converges to an element in  $\widehat{A}$ .

Yang: To be completed.

Yang: When is the homomorphism  $M \to N$  continuous?

By the universal property of the inverse limit, we get a covariant functor from the category of A-modules to the category of topological  $\widehat{A}$ -modules, which sends an A-module M to  $\widehat{M}$  and a morphism  $f: M \to N$  to the induced morphism  $\widehat{f}: \widehat{M} \to \widehat{N}$ .

#### Lemma A.6.12. Let

$$0 \rightarrow M_1 \rightarrow M_2 \rightarrow M_3 \rightarrow 0$$

be an exact sequence of finite A-modules. Then the sequence of  $\widehat{A}$ -modules

$$0 \to \widehat{M}_1 \to \widehat{M}_2 \to \widehat{M}_3 \to 0$$

is still exact.

Proof. Yang: To be completed.

**Lemma A.6.13.** Let  $\widehat{A}$  be the formal completion of a noetherian ring A with respect to an ideal I. Suppose that I is generated by  $a_1, ..., a_n$ . Then we have an isomorphism of topological rings

$$\widehat{A} \cong A[[X_1, \dots, X_n]]/(X_1 - a_1, \dots, X_n - a_n).$$

Proof. Yang: To be completed.

**Proposition A.6.14.** Let A be a noetherian ring and I an ideal of A. Then the formal completion  $\widehat{A}$  of A with respect to I is a noetherian ring.

Proof. Yang: To be completed.

**Proposition A.6.15.** Let A be a noetherian ring and I an ideal of A. Then the formal completion  $\widehat{A}$  of A with respect to I is a flat A-module.

Proof. Yang: To be completed.

**Proposition A.6.16.** Let  $\widehat{A}$  be completion of a noetherian ring A with respect to an ideal I and M a finite A-module. Then the natural map  $M \otimes_A \widehat{A} \to \widehat{M}$  is an isomorphism.

Proof. Yang: To be completed.

**Proposition A.6.17.** Let A be a noetherian ring and  $\mathfrak{m}$  a maximal ideal of A. Then the formal completion  $\widehat{A}$  of A with respect to  $\mathfrak{m}$  is a local ring with maximal ideal  $\mathfrak{m}\widehat{A}$ .

Proof. Yang: To be completed.

### A.6.2 Complete local rings

Let  $(A, \mathfrak{m}, \mathsf{k})$  be a noetherian complete local ring. We say that A is of equal characteristic if char  $A = \operatorname{char} \mathsf{k}$ , and of mixed characteristic if char  $A \neq \operatorname{char} \mathsf{k}$ . In latter case, char  $\mathsf{k} = p$  and char A = 0 or  $\operatorname{char} A = p^k$ .

The goal of this subsection is the following structure theorem for noetherian complete local rings due to Cohen.

**Theorem A.6.18** (Cohen Structure Theorem). Let  $(A, \mathfrak{m}, k)$  be a noetherian complete local ring of dimension d. Then

- (a) A is a quotient of a noetherian regular complete local ring;
- (b) if A is regular and of equal characteristic, then  $A \cong \mathsf{k}[[X_1, \dots, X_d]];$
- (c) if A is regular, of mixed characteristic (0,p) and  $p \notin \mathfrak{m}^2$ , then  $A \cong D[[X_1,\ldots,X_{d-1}]]$ , where  $(D,p,\mathsf{k})$  is a complete DVR;
- (d) if A is regular, of mixed characteristic (0, p) and  $p \in \mathfrak{m}^2$ , then  $A \cong D[[X_1, \dots, X_d]]/(f)$ , where  $(D, p, \mathsf{k})$  is a complete DVR and f a regular parameter.

#### Some facts about complete local rings

To prove the Cohen Structure Theorem, we first list some preliminary results on complete local rings. Most of them are independently important and can be used in other contexts.

**Theorem A.6.19** (Hensel's Lemma). Let  $(A, \mathfrak{m}, \mathsf{k})$  be a complete local ring,  $f \in A[X]$  a monic polynomial and  $\overline{f} \in \mathsf{k}[X]$  its reduction modulo  $\mathfrak{m}$ . Suppose that  $\overline{f} = \overline{g} \cdot \overline{h}$  for some polynomials  $\overline{g}, \overline{h} \in \mathsf{k}[X]$  such that  $\gcd(\overline{g}, \overline{h}) = 1$ . Then the factorization lifts to a unique factorization  $f = g \cdot h$  in A[X] such that g and h are monic polynomials.

Proof. Yang: To be completed.

**Remark A.6.20.** Note that the Hensel's Lemma does not require A to be noetherian.

**Lemma A.6.21.** Let k be a field of characteristic p. Then there exists a complete DVR (D, p, k) of mixed characteristic (0, p).

Proof. Yang: To be completed.

**Lemma A.6.22.** Given k a field of characteristic p, there exists a unique complete local ring (R, pR, k) of mixed characteristic  $(p^k, p)$ .

Proof. Yang: To be completed.

**Proposition A.6.23.** Let  $(A, \mathfrak{m}, \mathsf{k})$  be a noetherian complete local ring and M an A-module that is  $\mathfrak{m}$ -adically separated. Suppose  $\dim_{\mathsf{k}} M/\mathfrak{m}M < \infty$ . Then the basis of  $M \otimes_A \mathsf{k}$  as  $\mathsf{k}$ -vector space can be lifted to a generating set of M as an A-module.

Proof. Yang: To be completed.

#### Existence of coefficient rings

**Definition A.6.24** (Coefficient rings). Let  $(A, \mathfrak{m}, \mathsf{k})$  be a noetherian complete local ring.

When A is equal-characteristic, the coefficient ring (or coefficient field) is a homomorphism of rings  $k \to A$  such that  $k \to A \to A/\mathfrak{m}$  is an isomorphism.

When A is mixed-characteristic, the coefficient ring is a complete DVR (D,t) with a local homomorphism of rings  $D \hookrightarrow A$  such that the induced homomorphism  $D/(t) \to A/\mathfrak{m}$  is an isomorphism.

**Remark A.6.25.** Recall that a homomorphism of local rings  $f:(A,\mathfrak{m}_A)\to(B,\mathfrak{m}_B)$  is said to be local if  $f^{-1}(\mathfrak{m}_B)=\mathfrak{m}_A$ .

This subsubsection we show the following existence result of coefficient rings due to Cohen.

**Theorem A.6.26.** Every noetherian complete local ring  $(A, \mathfrak{m}, \mathsf{k})$  has a coefficient ring.

Proof of Theorem A.6.26 in characteristic 0. Note that for any  $n \in \mathbb{Z}$ ,  $n \notin \mathfrak{m}$ . Hence  $\mathbb{Q} \subset A$ . Let  $\Sigma := \{$  subfield in  $A \}$  and K a maximal element in  $\Sigma$  with respect to the inclusion. The set  $\Sigma$  is non-empty since  $\mathbb{Q} \in \Sigma$ . By Zorn's Lemma, K exists. Then K is a subfield of k by  $K \hookrightarrow A \twoheadrightarrow A/\mathfrak{m} \cong k$ . We claim that K is a coefficient field of A.

Suppose there is  $\bar{t} \in \mathsf{k} \setminus K$ . If  $\bar{t}$  is transcendent over K, lift  $\bar{t}$  to an element  $t \in A$ . Then for any polynomial  $f \neq 0 \in K[T]$ , we have  $f(\bar{t}) \neq 0 \in \mathsf{k}$ . Hence  $f(t) \notin \mathfrak{m}$ . This implies that  $1/f(t) \in A$ , whence  $K(t) \subset A$ . This contradicts the maximality of K. If  $\bar{t}$  is algebraic over K, let  $f \in K[T]$  be the minimal polynomial of  $\bar{t}$ . Then f is irreducible in K[T] and  $f(\bar{t}) = 0$ . Regard f as a polynomial in A[T] by  $K \hookrightarrow A$ . Note that char A = 0 implies that f is separable. By Hensel's Lemma (Theorem A.6.19), we can lift the root  $\bar{t}$  to an element  $t \in A$  such that f(t) = 0. Then K(t) is a field extension of K and  $K(t) \subset A$ . This contradicts the maximality of K again.

The same strategy does not work when char k = p > 0 since there might be inseparable extensions. To fix this, we need to introduce the notion of p-basis.

**Definition A.6.27.** Let  $\mathsf{k}$  be a field of characteristic p. A finite set  $\{t_1,\ldots,t_n\}\subset \mathsf{k}\setminus \mathsf{k}^p$  is called p-independent if  $[\mathsf{k}(t_1,\ldots,t_n):\mathsf{k}]=p^n$ . A set  $\Theta\subset \mathsf{k}\setminus \mathsf{k}^p$  is called a p-independent if its any finite subset is p-independent. A p-basis for  $\mathsf{k}$  is a maximal p-independent set  $\Theta\subset \mathsf{k}\setminus \mathsf{k}^p$ .

Proof of Theorem A.6.26 in characteristic p. Choose  $\Theta \subset A$  such that its image in  $A/\mathfrak{m}$  is a p-basis for k.

Yang: To be completed.

Proof of Theorem A.6.26 in mixed characteristic. Yang: To be completed.

#### **Proof of Cohen Structure Theorem**

### A.6.3 Unique factorization of regular local rings

**Theorem A.6.28** (Weierstrass Preparation Theorem). Let  $(A, \mathfrak{m})$  be a noetherian complete local ring,  $f = \sum_{n=0}^{\infty} a_n X^n \in A[[X]]$  a power series with  $f \not\equiv 0 \mod \mathfrak{m}$ . Then there exists a unique factorization of the form f = ug, where u is a unit in A[[X]] and g is a polynomial of the form

$$g = X^d + b_{d-1}X^{d-1} + \dots + b_0,$$

where  $b_i \in \mathfrak{m}$  for all i.

# Appendix B

# Homological Algebra

### **B.1** Complexes and Homology

**Definition B.1.1.** Let  $A_{\bullet}$  and  $B_{\bullet}$  be two complexes in  $\mathcal{A}$  and  $\varphi_{\bullet}, \psi_{\bullet} : A_{\bullet} \to B_{\bullet}$  be two morphisms of complexes. A *homotopy* between  $\varphi_{\bullet}$  and  $\psi_{\bullet}$  is a collection of morphisms  $h_n : A_n \to B_{n-1}$  such that

$$\varphi_n - \psi_n = \mathrm{d}_{B_{n+1}} \circ h_n + h_{n-1} \circ \mathrm{d}_{A_n}.$$

In diagram, we have

$$\cdots \longrightarrow A_{n+1} \longrightarrow A_n \xrightarrow{d_{A_n}} A_{n-1} \longrightarrow \cdots$$

$$\downarrow^{h_n} \psi_n \middle|_{\varphi_n} \downarrow^{\varphi_n} \downarrow^{h_{n-1}}$$

$$\cdots \longrightarrow B_{n+1} \longrightarrow B_n \longrightarrow B_{n-1} \longrightarrow \cdots$$

### **B.2** Derived Functors

In this section, fix an abelian category A.

#### B.2.1 Resolution

**Definition B.2.1** (Resolution). Let  $A \in \mathcal{A}$ . A projective resolution (resp. flat resolution, free resolution) of A is an exact sequence

$$\cdots \rightarrow P_n \rightarrow P_{n-1} \rightarrow \cdots \rightarrow P_1 \rightarrow P_0 \rightarrow A \rightarrow 0$$

where each  $P_i$  is a projective (resp. flat, free) object in  $\mathcal{A}$ .

An *injective resolution* of A is an exact sequence

$$0 \to A \to I^0 \to I^1 \to I^2 \to \cdots \to I^n \to \cdots$$

where each  $I^i$  is an injective object in  $\mathcal{A}$ .

**Proposition B.2.2.** Let  $P_{\bullet}: \cdots \to P_1 \to P_0 \to A \to 0$  and  $Q_{\bullet}: \cdots \to Q_1 \to Q_0 \to B \to 0$  be complexes in  $\mathcal{A}$  such that  $P_i$  is projective and  $Q_{\bullet}$  is exact. Given a morphism  $f: A \to B$ , there exists a morphism of complexes  $f_{\bullet}: P_{\bullet} \to Q_{\bullet}$  such that  $f_0 = f$ . In particular, any two such morphism of complexes are homotopic.

Dually, let  $I^{\bullet}: 0 \to A \to I^{0} \to I^{1} \to \cdots$  and  $J^{\bullet}: 0 \to B \to J^{0} \to J^{1} \to \cdots$  be complexes in  $\mathcal{A}$  such that  $J^{i}$  is injective and  $I^{\bullet}$  is exact. Given a morphism  $f: A \to B$ , there exists a morphism of complexes  $f^{\bullet}: I^{\bullet} \to J^{\bullet}$  such that  $f^{0} = f$ . In particular, any two such morphism of complexes are homotopic.

Proof. Yang: To be completed.

**Definition B.2.3.** For an object  $A \in \mathcal{A}$ , the *projective dimension* of A, denoted proj. dim A, is the smallest integer n such that there exists a projective resolution

$$0 \to P_n \to P_{n-1} \to \cdots \to P_1 \to P_0 \to A \to 0$$

of A of length n. If no such n exists, we set proj. dim  $A = \infty$ .

Dually, the *injective dimension* of A, denoted inj. dim A, is the smallest integer n such that there exists an injective resolution

$$0 \to A \to I^0 \to I^1 \to \cdots \to I^{n-1} \to I^n \to 0$$

of A of length n. If no such n exists, we set inj. dim  $A = \infty$ .

### **B.3** Applications to Commutative Algebra

### **B.3.1** Homological dimension

**Lemma B.3.1.** Let A be a ring and M an A-module. Then

$$\sup_{M} \operatorname{proj.dim} M = \sup_{N} \operatorname{inj.dim} N.$$

*Proof.* Note that

proj. dim 
$$M \leq n$$

if and only if

$$\operatorname{Ext}_{n+1}^A(M,N) = 0, \quad \forall N.$$

And this is equivalent to

inj. dim 
$$N \leq n$$
.

**Remark B.3.2.** In fact, for fix N, we have

inj. dim 
$$N \leq n$$

if and only if

$$\operatorname{Ext}_{n+1}^{A}(A/I, N) = 0, \quad \forall I$$

By Lemma Yang: ?. Hence we have

$$\sup_{M \text{ finite}} \text{proj.} \dim M = \sup_{M} \text{proj.} \dim M = \sup_{N} \text{inj.} \dim N.$$

**Definition B.3.3.** Let A be a ring. The *homological dimension* of A, denoted hl. dim A, is defined as

hl. 
$$\dim A := \sup_{M} \operatorname{proj.} \dim M = \sup_{M} \operatorname{inj.} \dim M.$$

**Lemma B.3.4.** Let A be a noetherian ring, B a flat A-algebra and M a finite A-module. Then we have

$$\operatorname{Ext}_A^i(M,N) \otimes B \cong \operatorname{Ext}_B^i(M \otimes B, N \otimes M), \quad \forall N.$$

Proof. Yang: To be completed.

**Proposition B.3.5.** Let A be a noetherian ring. Then

hl. dim 
$$A = \sup_{\mathfrak{p} \in \operatorname{Spec} A} \operatorname{hl. dim} A_{\mathfrak{p}}$$
.

*Proof.* Compute homological dimension of A using  $\operatorname{Ext}_A^i(M,N)$  for finite M. The conclusion follows from Propostion B.3.4.

**Definition B.3.6.** Let  $(A, \mathfrak{m}, \mathsf{k})$  be a noetherian local ring. We say that a homomorphism of A-modules  $f: M \to N$  is *minimal* if the induced map  $M \otimes \mathsf{k} \to N \otimes \mathsf{k}$  is an isomorphism. Equivalently, f is minimal if and only if f is surjective and  $\operatorname{Ker} f \subset \mathfrak{m} M$ .

**Definition B.3.7.** Let A be a noetherian local ring and M a finite A-module. A minimal projective resolution of M is a projective resolution

$$\cdots \to P_n \xrightarrow{d_n} P_{n-1} \xrightarrow{d_{n-1}} \cdots \to P_1 \xrightarrow{d_1} P_0 \xrightarrow{d_0} M \to 0$$

such that each homomorphism  $P_i \to \operatorname{Ker} d_{i-1}$  is minimal.

**Proposition B.3.8.** Let  $(A, \mathfrak{m}, \mathsf{k})$  be a noetherian local ring and M a finite A-module. Then M has a minimal projective resolution. Moreover, any two minimal projective resolutions of M are isomorphic.

*Proof.* Suppose  $M \otimes_A \mathsf{k} = \bigoplus \mathsf{k} \cdot \overline{x_i}$ . Lift  $x_i$  to elements of M. Then we have a minimal homomorphism  $d_0 : \bigoplus A \cdot x_i \to M$ . Similarly choose minimal homomorphisms  $d_k : A^{n_i} \to \operatorname{Ker} d_{i-1}$  for  $i = 1, 2, \cdots$ . This gives a minimal projective resolution.

Suppose we have two minimal homomorphism  $f,g:A^n\to M$ . After tensoring with k, we have isomorphisms between  $f\otimes k$  and  $g\otimes k$ . Lifting to A, we get an homomorphism  $\varphi:f\to g$ . Here homomorphism between f,g means a homomorphism  $A^n\to A^n$  such that  $f=g\circ\varphi$ . The homomorphism  $\varphi$  is represented by a matrix T. We have  $\det T\not\in\mathfrak{m}$ , whence  $\varphi$  is an isomorphism.  $\square$ 

**Proposition B.3.9.** Let  $L_{\bullet} \to M$  be a minimal projective resolution and  $P_{\bullet}$  be an arbitrary projective resolution of M. Then we have  $P_{\bullet} \cong L_{\bullet} \oplus P'_{\bullet}$  for some exact complexes  $P'_{\bullet}$ .

*Proof.* By Propostion B.2.2, we have homomorphism

$$L_{\bullet} \xrightarrow{\varphi_{\bullet}} P_{\bullet} \xrightarrow{\psi_{\bullet}} L_{\bullet}.$$

between complexes. By Propostion B.2.2 again,  $T_{\bullet} := \psi_{\bullet} \circ \varphi_{\bullet}$  is homotopic to the identity by  $h_{\bullet}$ . Suppose  $T_{\bullet}$  is represented by a matrix. Since  $L_{\bullet}$  is minimal, we have

$$(T - \mathrm{id})(L_n) = (\mathrm{d}_{n+1} \circ h_n + h_{n-1} \circ \mathrm{d}_n)(L_n) \subset \mathfrak{m}L_n.$$

Then  $\det T \notin \mathfrak{m}$  and hence  $T_{\bullet}$  is an isomorphism. It follows that  $\psi_{\bullet}$  is surjective, whence it splits  $P_{\bullet}$  into a direct sum  $L \oplus P'_{\bullet}$  since  $L_{\bullet}$  is projective. By the Five Lemma, we see that  $P'_{\bullet}$  is exact.  $\square$ 

**Lemma B.3.10.** Let  $(A, \mathfrak{m}, \mathsf{k})$  be a noetherian local ring and M a finite A-module. Then proj. dim  $M \leq n$  if and only if  $\operatorname{Tor}_{n+1}^A(M, \mathsf{k}) = 0$ .

*Proof.* The necessity is clear. For the sufficiency, we have a minimal projective resolution

$$\cdots \to P_{n+1} \xrightarrow{\mathrm{d}_{n+1}} P_n \xrightarrow{\mathrm{d}_n} P_{n-1} \xrightarrow{\mathrm{d}_{n-1}} \cdots \to P_1 \xrightarrow{\mathrm{d}_1} P_0 \xrightarrow{\mathrm{d}_0} M \to 0.$$

Let  $C := \operatorname{Im} d_n$ . Then we have

$$0 \to P_{n+1} \xrightarrow{\mathrm{d}_{n+1}} P_n \xrightarrow{\mathrm{d}_n} C \to 0.$$

Hence  $\operatorname{Tor}_1^A(C, \mathbf{k}) \cong \operatorname{Tor}_{n+1}^A(M, \mathbf{k}) = 0$ . Let  $K = \operatorname{Kerd}_n$ . Then we have the short exact sequence

$$0 \to K \to P_n \to C \to 0.$$

Since  $\operatorname{Tor}_{1}^{A}(C, \mathbf{k}) = 0$ , there is an exact sequence

$$0 \to K \otimes_A \mathsf{k} \to P_n \otimes_A \mathsf{k} \to C \otimes_A \mathsf{k} \to 0.$$

Since  $P_n \to C$  is minimal, we have  $K \otimes_A \mathsf{k} = 0$ . By the Nakayama's lemma, K = 0. This implies that proj. dim  $C \leq 0$  and hence proj. dim  $M \leq n$ .

**Proposition B.3.11.** Let  $(A, \mathfrak{m}, \mathsf{k})$  be a noetherian local ring. Then hl. dim A = proj. dim  $\mathsf{k}$  (finite or infinite).

*Proof.* The inequality hl. dim  $A \geq \text{proj.} \dim \mathsf{k}$  is by definition. Conversely, we can compute  $\operatorname{Tor}_{n+1}^A(M,\mathsf{k})$  using minimal projective resolution of  $\mathsf{k}$  for any finite A-module M. By Lemma B.3.10, we have proj. dim  $M \leq n$  if and only if  $\operatorname{Tor}_{n+1}^A(M,\mathsf{k}) = 0$ . This implies that proj. dim  $M \leq n$  for all finite A-modules M if proj. dim  $\mathsf{k} = n$ . By Remark B.3.2, we have hl. dim  $A \leq n$ .

**Proposition B.3.12.** Let  $(A, \mathfrak{m})$  be a noetherian local ring and M a finite A-module. Let  $a \in \mathfrak{m}$  be an M-regular element. Then proj. dim  $M/aM = \operatorname{proj.dim} M + 1$ . Here we set  $\infty + 1 = \infty$ .

*Proof.* We have an exact sequence

$$0 \to M \xrightarrow{*a} M \to M/aM \to 0.$$

Take the long exact sequence with respect to Tor(-, k), we get

$$\cdots \to \operatorname{Tor}_{i+1}^A(M,\mathsf{k}) \to \operatorname{Tor}_{i+1}^A(M/aM,\mathsf{k}) \to \operatorname{Tor}_i^A(M,\mathsf{k}) \xrightarrow{*a} \operatorname{Tor}_i^A(M,\mathsf{k}) \to \cdots$$

Since the derived homomorphism of \*a is zero, we have  $\operatorname{Tor}_{i+1}^A(M/aM, \mathsf{k}) = 0$  if and only if  $\operatorname{Tor}_i^A(M, \mathsf{k}) = 0$ . By Lemma B.3.10, we have proj. dim  $M/aM = \operatorname{proj.dim} M + 1$ .

### B.3.2 Depth and regularity by homological algebra

**Proposition B.3.13.** Let  $(A, \mathfrak{m}, \mathsf{k})$  be a noetherian local ring and M a finite A-module. Then

$$\operatorname{depth} M := \inf\{i : \operatorname{Ext}_A^i(\mathsf{k}, M) \neq 0\}.$$

*Proof.* Let  $a \in \mathfrak{m}$  be M-regular and N = M/aM. Then we claim that

$$\inf\{i : \operatorname{Ext}_A^i(\mathsf{k}, N) \neq 0\} = \inf\{i : \operatorname{Ext}_A^i(\mathsf{k}, M) \neq 0\} - 1.$$

Indeed, we have an exact sequence

$$0 \to M \xrightarrow{a} M \to N \to 0.$$

It induces a long exact sequence

$$\cdots \to \operatorname{Ext}\nolimits_A^{i-1}(\mathsf{k},M) \to \operatorname{Ext}\nolimits_A^{i-1}(\mathsf{k},N) \to \operatorname{Ext}\nolimits_A^i(\mathsf{k},M) \xrightarrow{\operatorname{Ext}\nolimits_A^i(\mathsf{k},\operatorname{Mult}\nolimits_a)} \operatorname{Ext}\nolimits_A^i(\mathsf{k},M) \to \cdots.$$

Note that  $a \in \mathfrak{m}$ , then  $\operatorname{Ext}_A^i(\mathsf{k}, \operatorname{Mult}_a) = 0$ . It follows that when  $\operatorname{Ext}_A^{i-1}(\mathsf{k}, M) = 0$ , we have  $\operatorname{Ext}_A^{i-1}(\mathsf{k}, N) = 0$  iff  $\operatorname{Ext}_A^i(\mathsf{k}, M) = 0$ , whence the claim.

Let  $n = \inf\{i : \operatorname{Ext}_A^i(\mathsf{k}, M) \neq 0\}$ . Induct on n. Suppose first n = 0. Since  $\mathsf{k}$  is a simple A-module, there is an injective homomorphism  $\mathsf{k} \to M$ . Then  $\mathfrak{m} \in \operatorname{Ass} M$  and hence depth M = 0.

Suppose n > 0., let  $a_1, \dots, a_m \in \mathfrak{m}$  be any M-regular sequence. Using the claim inductively on  $M/(a_1, \dots, a_m)M$ , we have  $n \geq \text{depth}$ . If M has no regular element, then  $\mathfrak{m} \subset \bigcup_{\mathfrak{p} \in \text{Ass } M} \mathfrak{p}$ . Then  $\mathfrak{m} = \mathfrak{p}$  for some  $\mathfrak{p} \in \text{Ass } M$ . This show that we can find  $x \neq 0 \in M$  such that  $\mathfrak{p} = \text{Ann } x$ . It gives a homomorphism  $\mathsf{k} = A/\mathfrak{m} \to M$ . That is a contradiction and hence M has a regular element. Let a be M-regular and N = M/aM. Then depth N = n - 1 by the claim and induction hypothesis. Hence we have depth  $M \geq n$ .

**Lemma B.3.14.** Let  $(A, \mathfrak{m}, \mathsf{k})$  be a noetherian local ring. Suppose we have exact sequences

$$0 \to A^{n_r} \xrightarrow{\mathrm{d}_r} A^{n_{r-1}} \xrightarrow{\mathrm{d}_{r-1}} \cdots \to A^{n_1} \xrightarrow{\mathrm{d}_1} A^{n_0},$$

such that  $A^{n_i} \to \operatorname{Ker} d_{i-1}$  is minimal for all i. Then depth  $A \ge r$ .

*Proof.* Since  $d_r$  is injective and its image is contained in  $\mathfrak{m}A^{n_{r-1}}$ , we can choose  $t \in \mathfrak{m}$  that is not a zero divisor. Denote the sequence by  $C_{\bullet}$ . Then we have a short exact sequence of complexes

$$0 \to C_{\bullet} \xrightarrow{*t} C_{\bullet} \to C_{\bullet}/tC_{\bullet} \to 0.$$

Consider the long exact sequence in homology

$$\cdots \to H_i(C_{\bullet}) \xrightarrow{*t} H_i(C_{\bullet}) \to H_i(C_{\bullet}/tC_{\bullet}) \to H_{i-1}(C_{\bullet}) \xrightarrow{*t} H_{i-1}(C_{\bullet}) \to \cdots$$

Since  $C_{\bullet}$  is exact, we have  $H_i(C_{\bullet}) = 0$  for all i. In particular,  $H_i(C_{\bullet}/tC_{\bullet}) = 0$  for all  $i \geq 2$ . Inductively, we can choose a regular sequence of length r in  $\mathfrak{m}$ .

**Lemma B.3.15.** Let  $(A, \mathfrak{m}, \mathsf{k})$  be a noetherian local ring and M a finite A-module. Suppose there is an injective homomorphism  $\mathsf{k} \to M$ . Then proj. dim  $M \ge \dim_{\mathsf{k}} T_{A,\mathfrak{m}}$ .

*Proof.* Let  $x_1, \dots, x_n \subset \mathfrak{m} \setminus \mathfrak{m}^2$  such that their images in  $\mathfrak{m}/\mathfrak{m}^2$  form a basis. Then we have a complex

$$K_{\bullet} := 0 \to \wedge^n A^{\oplus n} \xrightarrow{\mathrm{d}_n} \wedge^{n-1} A^{\oplus n} \xrightarrow{\mathrm{d}_{n-1}} \cdots \to \wedge^1 A^{\oplus n} \xrightarrow{\mathrm{d}_1} \wedge^0 A^{\oplus n} \xrightarrow{\mathrm{d}_0} \mathsf{k} \to 0,$$

where

$$d_r: \wedge^r A^{\oplus n} \to \wedge^{r-1} A^{\oplus n}, \quad e_{i_1} \wedge \dots \wedge e_{i_r} \mapsto \sum_{k=1}^r (-1)^k x_{i_k} e_{i_1} \wedge \dots \wedge \widehat{e_{i_k}} \wedge \dots \wedge e_{i_r}.$$

Here  $\widehat{e_{i_k}}$  means that we omit the k-th element. Let  $P_{\bullet} \to M$  be the minimal projective resolution of M. Then we have a homomorphism of complexes

$$\varphi_{\bullet}:K_{\bullet}\to P_{\bullet}$$

induced by the injective homomorphism  $k \to M$ .

We claim that  $\varphi_i$  is injective and splits  $P_i$  into a direct sum  $K_i \oplus F_i$  with  $F_i$  free for all  $i \geq 0$ . Since  $K_i$  and  $P_i$  are free, we just need to show that  $\varphi_i \otimes_A \operatorname{id}_k$  is injective. Induct on i. For i = 0, note that  $k \to M \otimes_A k$  is injective, by the commutative diagram

$$A \xrightarrow{\varphi_0 \otimes_A \mathrm{id}_{\mathsf{k}} \downarrow} \qquad \qquad \downarrow \qquad ,$$

$$P_0 \otimes_A \mathsf{k} \xrightarrow{\cong} M \otimes_A \mathsf{k}$$

the image of  $\varphi_0 \otimes_A \mathrm{id}_k$  is not zero in  $P_0 \otimes_A k$ .

For i > 0, since  $K_{i-1}$  and  $P_{i-1}$  are free, we have a natural isomorphism between

$$\mathfrak{m}K_{i-1}\otimes_A\mathsf{k}\to\mathfrak{m}P_{i-1}\otimes_A\mathsf{k}$$

and

$$K_{i-1} \otimes_A \mathfrak{m}/\mathfrak{m}^2 \to P_{i-1} \otimes_A \mathfrak{m}/\mathfrak{m}^2$$
.

We have a commutative diagram

$$K_{i} \otimes_{A} \mathsf{k} \longrightarrow \mathfrak{m} K_{i-1} \otimes_{A} \mathsf{k} . \tag{B.1}$$

$$\downarrow \qquad \qquad \downarrow \qquad \qquad \downarrow$$

$$P_{i} \otimes_{A} \mathsf{k} \longrightarrow \mathfrak{m} P_{i-1} \otimes_{A} \mathsf{k}$$

Since  $P_{i-1}/K_{i-1} \cong F_{i-1}$  is free, the right vertical map in (B.1) is injective. By construction of  $K_{\bullet}$ ,  $K_i \otimes_A \mathsf{k} \to \mathfrak{m} K_{i-1} \otimes_A \mathsf{k}$  is injective. Hence the left vertical map in (B.1) is injective. This completes the proof of the claim.

By the claim,  $P_i \neq 0$  for all  $i \leq n$  and the conclusion follows.

**Proposition B.3.16** (Auslander-Buchsbaum formula). Let A be a noetherian local ring and M a finite A-module. Suppose proj. dim  $M < \infty$ . Then proj. dim  $M = \operatorname{depth} A - \operatorname{depth} M$ .

*Proof.* We have a minimal projective resolution

$$0 \to A^{n_r} \to A^{n_{r-1}} \to \cdots \to A^{n_1} \to A^{n_0} \to M \to 0$$

By Lemma B.3.14, we have depth  $A \ge \text{proj.dim } M$ .

Induct on depth M. Suppose depth M=0. Then by Proposition B.3.13, we have  $\operatorname{Hom}_A(\mathsf{k},M)\neq 0$ , whence there is an injective homomorphism  $\mathsf{k}\to M$ . By Lemma B.3.15, we have

$$\operatorname{depth} A \geq \operatorname{proj.dim} M \geq \operatorname{dim}_{\mathsf{k}} T_{A,\mathfrak{m}} \geq \operatorname{depth} A.$$

If depth M > 0, choose a regular element  $a \in \mathfrak{m}$  that is M-regular. Then by Propostion B.3.12, we have

$$\operatorname{depth} M + \operatorname{proj.dim} M = \operatorname{depth}(M/aM) - 1 + \operatorname{proj.dim}(M/aM) + 1 = \operatorname{depth} A.$$

**Theorem B.3.17.** Let  $(A, \mathfrak{m})$  be a noetherian local ring. Then A is regular at  $\mathfrak{m}$  if and only if hl. dim  $A < \infty$ .

*Proof.* Suppose A is regular at  $\mathfrak{m}$ . Let  $x_1, \dots, x_n$  be a minimal generating set of  $\mathfrak{m}$ . Then  $x_1, \dots, x_n$  is an A-regular sequence since A is regular at  $\mathfrak{m}$ . By Proposition B.3.12, we have proj. dim  $k = \text{proj.} \dim A/(x_1, \dots, x_n)A = n + \text{proj.} \dim A = n$ .

Conversely, suppose hl. dim  $A < \infty$ . Then by Proposition B.3.11, we have proj. dim  $k < \infty$ . We have

$$\dim_{\mathsf{k}} T_{A,\mathfrak{m}} \leq \operatorname{proj.dim} \mathsf{k} \leq \operatorname{depth} A \leq \dim_{\mathsf{k}} T_{A,\mathfrak{m}}.$$

The first " $\leq$ " follows from Lemma B.3.15. The second " $\leq$ " follows from Proposition B.3.16. Hence we see that A is regular at  $\mathfrak{m}$ .

Corollary B.3.18. Let  $(A, \mathfrak{m})$  be a noetherian local ring. Then A is regular if and only if it is regular at  $\mathfrak{m}$ .

*Proof.* The sufficiency is trivial. For the necessity, note that if A is regular, then hl. dim  $A < \infty$  by Theorem B.3.17. For any  $\mathfrak{p} \in \operatorname{Spec} A$ , we have a finite projective resolution

$$0 \to P_n \to P_{n-1} \to \cdots \to P_1 \to P_0 \to A/\mathfrak{p} \to 0.$$

Tensoring with  $A_{\mathfrak{p}}$ , we have a finite projective resolution of  $\kappa(\mathfrak{p})$ . By Theorem B.3.17 again, we see that  $A_{\mathfrak{p}}$  is regular at  $\mathfrak{p}$ .

**Lemma B.3.19.** Let A be a noetherian integral domain. Then A is a UFD if and only if every height 1 prime ideal of A is principal.

*Proof.* Yang: To be completed.

**Lemma B.3.20.** Let A be a noetherian integral domain and  $(x) \subset A$  a non-zero prime ideal. Then A is a UFD if and only if A[1/x] is a UFD.

Proof. Yang: To be completed.

**Theorem B.3.21.** Let  $A, \mathfrak{m}$  be a regular noetherian local ring. Then A is UFD.

Proof. Yang: To be completed.
